REFERENCE NOTES

he four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will e no duplication of numbers within a state.

igures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

bservation times given in the Station Index are in local standard time.

elayed data and corrections will be carried only in the June and December issues of this bulletin.

onthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bul-etin.

tations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be in-luded in this issue.

nless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in nches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard eather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

leet and hail were included in snowfall averages in Table 1, beginning January 1949.

mounts in Table 3 are from non-recording gage, unless otherwise indicated.

ata in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Sta-ion Index for observation time.

now on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground alues are at 4:30 a.m., PST and 5:30 a.m., MST.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

And also on a later date or dates.

Amounts included in following measurements, time distribution unknown.

Gage is equipped with a windshield.

This entry in time of observation column in Station Index means after rain.

Adjusted to a full month.

Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

Daily precipitation values and monthly total from recording gage.

Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

This entry in time of observation column in Station Index means sunset.

Trace, an amount too small to measure.

Includes total for previous month.

This entry in time of observation column in Station Index means variable.

ubscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) hecks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding ubscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

IDAHO

AUGUST 1952
Volume LV No. 8

SAN FRANCISCO: 1952

IDAHO - AUGUST 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

In contrast to August 1951, this month was very dry; in fact the statewide average precipitation was the lowest since 1944. Only a few stations reported totals in excess of the long-period mean for August and 18 stations reported no rain during the month. Temperatures averaged close to normal, despite much dry, sunny weather, and the extreme of 103° at three stations on the 5th was lower than the maximum usually recorded in August. Total sunshine in southern divisions, as indicated by Boise and Pocatello records, was above normal, while such records from Spokane, Washington and Missoula, Montana would indicate a deficiency of sunshine in the northern part of Idaho.

Most of the shower activity during August came in the first half of the month, with concentrations in the Northern Division on the 10th, the Southwestern Division on the 14th and in the Southeastern Division on the 2d, 3d, and 4th. There was no general storm period during the month and precipitation occurred almost entirely in connection with scattered thunderstorms. Thunderstorm activity was less than usual for August, however, and despite the dry conditions the number of forest fires was below average.

In general the weather was very good for crop growth, although lack of rain did affect pastures and lower ranges, as well as some crops on dry-land farms in the southeast. Grain harvesting was carried on at a rapid pace throughout the month, progressing from lower to higher elevations where considerable grain remained uncut at the close of the month. Much haying was done under very favorable conditions. Potatoes were maturing nicely and the sugar beet crop was generally in excellent condition at the end of the month. During the last week temperatures dropped considerably, especially at night, with several stations reporting early morning readings in the thirties. No frost damage was reported.

Storm damage was not extraordinary, but a lightning strike took one life. On the 2d at 5 p.m. a hailstorm about six miles east of Preston destroyed about 90 percent of the grain crop on 500 acres. Hailstones up to 5/8 inch in diameter were reported. On the 9th, at about 3:15 p.m., lightning struck the home of Sam Moss at Marsh Center, near Downey, electrocuting Mrs. Moss but leaving her husband and two children, who were also indoors, uninjured. During the afternoon of the 10th a ten-minute hailstorm at Mesa did considerable damage to fruits. About 4:00 p.m. on the 13th high wind and rain did some damage to buildings and trees at Cascade, and the following evening high wind damaged a greenhouse and some seed crops at the Branch Experiment Station near Parma.

REFERENCE NOTES

ie four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will ; no duplication of numbers within a state.

igures and letters following the station name such as 12 SSW, indicate distance in miles and direction from the post office.

oservation times given in the Station Index are in local standard time.

elayed data and corrections will be carried only in the June and December issues of this bulletin.

onthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

tations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

nless otherwise indicated, - dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in nches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard eather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

leet and hail were included in snowfall averages in Table 1, beginning January 1949.

mounts in Table 3 are from non-recording gage, unless otherwise indicated.

ata in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Staion Index for observation time.

now on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground alues are at 4:30 a.m., PST and 5:30 a.m., MST.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

And also on a later date or dates.

Amounts included in following measurements, time distribution unknown.

Gage is equipped with a windshield.

This entry in time of observation column in Station Index means after rain.

Adjusted to a full month.

Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

Daily precipitation values and monthly total from recording gage.

Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

This entry in time of observation column in Station Index means sunset.

Trace, an amount too small to measure.

Includes total for previous month.

This entry in time of observation column in Station Index means variable.

ubscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) hecks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding ubscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1952

IDAHO - SEPTEMBER 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

The latter half of September was so persistently warm and dry that average temperatures for the month were well above normal and precipitation totals much below normal throughout the State. Only a few stations in the Northern Division had precipitation totalling more than one inch, although September normals exceed one inch at all but a very few stations in that Division, while several stations in the Southwestern Division reported no rain and others only a trace. The one station in the State reporting precipitation in excess of normal was Payette, where a total of 0.55 inch on the 6th was in itself more than the normal September total for the station.

Almost without exception, daily average temperatures were above normal from the 15th to the end of the month, with clear skies predominating throughout that period. Sunshine was well above normal for the month, totalling 85 percent of possible at Boise and 87 percent at Pocatello. Winds were lighter than usual for September and no damaging storms were reported. Thunderstorms were rather frequent, though scattered, during the first two weeks, while during the latter half of the month very few thunderstorms were reported.

The periods of principal shower and thunderstorm activity were the 3d to 6th, and 10th to 12th, although in the Northern Division numerous showers were reported every day from the 3d to the 13th. Skies began to clear on the 13th, as a cool, dry air mass moved in from the north and northwest. By early morning of the 14th freezing temperatures were recorded over a large part of the State, resulting in the freezing of potato vines and garden vegetables.

From the agricultural standpoint the weather of the month was generally very favorable. Some delay in grain harvesting was experienced early in the month in northern sections because of rains, but by the end of the 3d week the grain harvest had been completed in all but a few late districts. Potato digging was well under way during the latter half of the month, while sugar beets were maturing with digging expected to begin early in October. Third cuttings of hay were made in many areas, pears and peaches were picked, dry bean harvest was completed and seed crops were being harvested under very favorable conditions. Some fall planting was done during the month, but in general the soil was too dry, a condition that also affected pastures and lower ranges. The fire hazard on forest and range lands was unusually high during the latter half of the month, but the number of fires was relatively small, due largely to the absence of lightning.

DJS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurements, time distribution unknown.

/ Gage is equipped with a windshield.

This entry in time of observation column in Station Index means after rain.

Adjusted to a full month.

Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

Daily precipitation values and monthly total from recording gage.

Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

This entry in time of observation column in Station Index means sunset.

Trace, an amount too small to measure.

Includes total for previous month.

This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1952

IDAHO - OCTOBER 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Dry, sunny weather prevailed throughout the State this month; prolonging to six weeks or more the unseasonably warm, dry spell that began in mid-September. This contrasts sharply with October 1951, which was the wettest on record and averaged nearly 7° cooler than October 1952. State-wide average precipitation was the lowest since such records began in 1893. In the Northern and Southwestern Divisions lower averages were recorded in only one October, 1895, but the Southeastern Division average of a trace was the lowest on record, the previous low being 0.07 in 1917. Not one station in the State failed to report subnormal precipitation, while at the same time reporting above-normal temperatures.

Sunshine was far above the mean of all past years of record, winds were generally light and thunderstorms conspicuous by their absence. No damaging storms were reported and only a very few stations reported snowfall - the greatest total being 2.4 inches at Dixie in Idaho County.

The first 18 days of the month were almost wholly without precipitation in the State, while average daily temperatures were almost continuously above normal throughout the month. From the 19th to the 24th a few showers occurred, mostly in the Northern Division. During the last three days of the month two weak storm fronts moved eastward across Idaho, producing general light showers in the north and in the northern half of the Southwestern Division.

Harvesting operations were carried on under nearly ideal conditions throughout the month. Potato and sugar beet digging were more than 80 percent complete by the end of the month, with high yields and good quality reported for both crops. Clover seed harvest was virtually unimpeded this year, in contrast to 1951, when some of the crop was lost because of rains. Most of the apple crop was picked during the month. As for soil preparation and fall seeding, the continued drought was a definite handicap. In northern areas, where early planting had been accomplished, stands of grain were spotty, while in extensive areas in the east fall seeding of wheat was impossible because of dry soils. Pastures and ranges were below normal for the season. Very few spots in the State had not experienced killing frost by the close of the month. The fire hazard on forest and range lands was unusually high but because of the absence of lightning storms there were comparatively few fires, none of which covered any extensive area.

DJS

TEMPERATURE AND PRECIPITATION AVERAGES IN THIS TABLE HAVE BEEN WEIGHTED ACCORDING TO AREA.

ANNOUNCING THE RESUMPTION OF PUBLICATION OF HOURLY PRECIPITATION DATA

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will e no duplication of numbers within a state.

igures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

bservation times given in the Station Index are in local standard time.

elayed data and corrections will be carried only in the June and December issues of this bulletin.

onthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

tations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be inluded in this issue.

nless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in nches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard eather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

leet and hail were included in snowfall averages in Table 1, beginning January 1949.

mounts in Table 3 are from non-recording gage, unless otherwise indicated.

ata in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Staion Index for observation time.

now on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground alues are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is easured at selected stations when the depth of snow on the ground is two inches or more.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

And also on a later date or dates.

Amounts included in following measurements, time distribution unknown.

Gage is equipped with a windshield.

This entry in time of observation column in Station Index means after rain.

Adjusted to a full month.

Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station,have been adjusted to represent the value for the full month.

Daily precipitation values and monthly total from recording gage.

Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

This entry in time of observation column in Station Index means sunset.

Trace, an amount too small to measure.

Includes total for previous month.

This entry in time of observation column in Station Index means variable.

ubscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) hecks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding ubscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1953

IDAHO - NOVEMBER 1952

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

With precipitation over the State averaging only 35 percent of the long-period mean, this was among the driest Novembers in 60 years of record in Idaho. The Northern Division, where precipitation averaged only 0.75 inch, has had lower November averages in only two years, 1936 and 1929. The month was also among the coldest on record, averaging 5.4° below the November mean for the State; the Southeastern Division average of 26.8° was the lowest on record. Average snowfall was less than 50 percent of the November mean, but with the persistence of subnormal temperatures, particularly during the latter half of the month, fairly good accumulations of snow were present in mountain areas at the close. Sunshine was unusually abundant, especially in the southwestern portion of the State where Boise recorded 82 percent of possible, against a normal of 51 percent for November.

Drought, which had persisted for six weeks or more prior to November 1st, continued until near mid-month. Before the 12th little precipitation of consequence was reported anywhere in the State, but from that date through the 15th all sections received substantial amounts of rain or snow. During the early part of the month the paths of storm centers were far to the north and storm fronts extending southward from the centers generally dissipated before reachin Idaho. A sudden change in pattern brough storm centers farther south on the 12th an 13th, and finally one center moved southeastward through California and Nevada o the 15th, drawing colder air from the nort into the northwest States. High pressur accompanying this colder air persisted fo the balance of the month, effectively blocking further movement of Pacific storm front in these latitudes. The only storm fron affecting Idaho during this period was on that moved southward and southwestward acros the Continental Divide, bringing light sno to most sections of the State on the 24th an 25th. The persistence of a relatively stagnant air mass, together with several clea nights and a light snow cover in many sections, resulted in temperatures generall 10° to 20° below normal during the last eigh or ten days of the month.

The dry, sunny weather early in the mont permitted rapid completion of potato an sugar beet harvests, but much fall plowin was left undone and in some dryland whea areas no fall planting was possible becaus of the lack of soil moisture. No damagin storms were reported and highways remaine open, except through some of the highe passes which normally are closed throughou the winter.

DJS

TEMPERATURE AND PRECIPITATION AVERAGES IN THIS TABLE HAVE BEEN WEIGHTED ACCORDING TO AREA.

ANNOUNCING THE RESUMPTION OF PUBLICATION OF HOURLY PRECIPITATION DATA

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station,have been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

DECEMBER 1952
Volume LV No. 12

See note concerning, "Hourly Precipitation Data" on page 141 of this issue.

SAN FRANCISCO: 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Although only 1.6° above the 56-year mean, the average temperature for the month was more than 5° above that of a year ago. Only about 15 percent of the stations reported average temperatures below normal, and they were nearly all in the central part of the State. Precipitation averaged a little above normal for the entire State, in spite of a deficiency in the Northern Division. From Coeur d'Alene northward to Bonners Ferry all stations recorded precipitation in excess of the December mean, but all other stations in the Division were below the mean, with deficiencies especially pronounced in Shoshone County and in the Clearwater River Basin. Other notable deficiencies were apparent in the extreme southeastern counties and along the Snake River from around Burley downstream to the Oregon Border. On the other hand, there were a number of stations where precipitation exceeded the December mean by 75 percent or more. The Lost and Wood Rivers, the Boise, Payette and Weiser Basins all fared well in the matter of precipitation, after an unusually dry autumn. Snowfall averaged about 30 percent above the 55-year mean, but less than half the record-breaking totals of December 1951. Snowfall was generally very light at stations below 3500 feet, particularly in the Southwestern Division, but more than fifty inches fell at a number of stations, such as Hailey, Hill City, Lowman, Atlanta, and McCall. A preponderance of cloudy skies and heavy fog cut sunshine well below normal for the month; at Boise the number of foggy days equalled the all-time record for December.

The first ten days of the month brought frequent occurrences of precipitation to Idaho, as a succession of storm fronts from the Pacific moved across the northwestern States. Winds were stronger than usual during this period, temperatures were generally a little above normal and sunshine broke through only sporadically. Much of the snowfall of the month occurred during the first 10 days, with particularly heavy snow and strong winds in all divisions on the 7th. On that date a storm front moved rapidly eastward from a large, intense storm center that moved in on the coast of British Columbia. Sweeping across all of Idaho in about eight hours, the front brought the stormiest period of the month.

After the 10th, Idaho was generally under the influence of stationary or slow-moving high pressure systems that effectively blocked the eastward movement of Pacific storm fronts for a week or more. During this period, air masses stagnated in the Intermountain Region and heavy blankets of fog covered many of the large valleys in Idaho. Travel by air and highway were delayed by the fog on several days. Precipitation was light during this period, but on the 18th, a temporary breakdown of the high pressure system, and the slow eastward movement of a storm center, resulted in substantial precipitation throughout the State. This continued for three or four days, after which a short period of light scattered precipitation and lower temperatures prevailed until, on the 26th, an approaching storm front brought rising temperatures and more widespread precipitation.

Aside from traffic delays due to fog and occasional drifting snow, December's weather had little direct effect on the economy of Idaho. High winds, such as those reported on the 7th,did little damage and no reports were received of damage due to glaze storms. Livestock apparently came through the month in good condition.

TEMPERATURE AND PRECIPITATION AVERAGES IN THIS TABLE HAVE BEEN WEIGHTED ACCORDING TO AREA.

ANNOUNCING THE RESUMPTION OF PUBLICATION OF HOURLY PRECIPITATION DATA

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTED DATA

SEPTEMBER 1952	Reactor Testing Station, precipitation on 11th should be .12, monthly total .12, greatest day .12 on 11th; days with .01 or more, 1.

ANNUAL SUMMARY 1952
Volume LV No. 13

KANSAS CITY: 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

The cold weather of the first quarter; the exceptionally heavy snowpack; and the unusually warm, dry autumn were the outstanding features of the year's weather in Idaho. Worthy of note also was the general deficiency of precipitation for the year. The average annual total for the Northern Division was only 71 percent of normal, while in the Southwestern and Southeastern Divisions the percentages were 82 and 84, respectively.

Temperatures below normal were reported in all sections of the State during January, February and March. April was the first month since the preceding September with above-normal temperatures. With the rather rapid coming of warmer weather in April, the unusually heavy snowpack quickly melted at lower and intermediate elevations, causing flooding on several streams in the southwestern and south-central portions of the State. On April 29th the Snake River at Weiser reached its highest level since 1910; at Cambridge the Weiser River rose to within 0.6 foot of the previous high; at Carey the Little Wood River went over its banks on the 22d; just below Magic Reservoir the Big Wood River on the 28th rose more than two feet above the previous high stage; and at Gooding on the 29th a crest stage of 10.67 feet surpassed the previous recorded high of 9.8 feet. The Portneuf River at Pocatello began spilling over its banks on April 15th and continued above bankful stage for more than a month, cresting on May 7th and May 8th at a stage of 5.4 feet. Minor flooding also occurred during May on Henrys Fork and on the Snake River north and northeast of Idaho Falls. Estimates of flood damage in southern Idaho indicate losses of approximately one million dollars, with agricultural losses accounting for about 90 percent of the total.

The crop season was better than average for the State. Several spells of rainy weather in May and June retarded planting in some areas, but July and August brought good growing weather with a minimum of destructive hail and windstorms. Harvest operations in all crops suffered very little interference from the weather and all in all crop losses because of weather elements were rather light throughout the season. Snow mold and smothering affected winter wheat in some areas, yet total production for the State was above average. Absence of prolonged hot spells and the unusually favorable harvest weather resulted in a new high average yield per acre of potatoes, with quality the highest in 12 years and far above that of 1951. Yield per acre of sugar beets was above average with no loss from fall rains, such as occurred the previous autumn. Frost damage to fruit was light and spotted. Dry peas suffered some frost damage in June but in spite of this the yield per acre was the second largest of record. One feature of the year's weather that was both favorable and detrimental was the prolonged dry, warm fall. This permitted uninterrupted harvest of late crops, but adversely affected fall seedings. In fact, in some areas, particularly in the Southeastern Division, lack of soil moisture prevented the planting of winter wheat.

Two lives were lost, both by lightning strikes, but the frequency of thunderstorms was, on the whole, below average. Destruction of crops and property by windstorms was relatively light and hail damage was widely scattered.

SNYNOPSIS BY MONTHS

JANUARY: Somewhat colder than usual, although not an exceptionally severe January. Precipitation a little above the long-period mean in Southern Divisions and a little below in the Northern Division. Above-average snowfall brought mountain snowpack to unusual depth in some areas.

FEBRUARY: Fifth consecutive month with below-normal temperatures; Northern Division deficiencies minor. Latter half of month particularly cold in southern portions. Precipitation near the February mean, with snowfall heavier than in the preceding two Februarys. Storm damage light, confined mainly to occasional disruption of telephone and power facilities, but weather described as "tough on livestock and feed". Record-breaking accumulations of snow in many mountain areas of Southwestern Division.

MARCH: Climaxing one of the longest winters in sixty years of record in Idaho, March was among the coldest on record. Six-month snowfall totals exceeded long-period mean for the State by nearly 100%. At the end of month snow had gone from lower elevations, but the high-elevation snowpack had not begun to melt. Fruit trees had not yet begun to produce buds, cattle were still on feed lots in most areas and little field work was accomplished.

APRIL: Temperatures finally rose to above-normal valu precipitation was subnormal and spring arrived rather ruptly in most of Idaho. Flooding occurred on the Sn River near Weiser from the 16th through the 21st, and ag during the last four days, reaching highest stage since 19 Some flooding also on Weiser River. Big and Little W Rivers experienced unprecedented floods with considera damage to canals, diversions, flumes, bridges and roa Portneuf out of its banks for several days in vicinity Pocatello, but only minor damage reported.

MAY: A generally pleasant month. Temperatures a lit above the long-period mean; precipitation about 90% of me Farm work progressed well except in an area of excess rainfall in Nez Perce, Lewis and Idaho Counties, where fi work and planting were delayed. Some storm damage from str winds on the 3rd and the 14th, but damage was scatter Flooding, compared with April, was minor. Portneuf at catello remained out of banks through 18th, Camas Creek Jefferson County, Snake near Heise, and Henrys Fork n Rexburg all experienced some flooding between 5th and 8 Estimates place total spring flood damage in southern Id at approximately one million dollars, with agricultu losses accounting for about 90% of total.

JUNE: A wet month with near normal temperatures. O June 1893 had higher average precipitation in Northern vision, and state-wide average was in upper 20% for 60-y period. Early part of month warm and dry, permitting ra progress in field work. Later rains delayed planting s areas, spoiled cut hay in others, and caused some damage cherries. Lightning strike killed boy and horse near Je ome on 5th. Hail and wind did scattered damage dur month.

JULY: Comparatively cool with deficiency of rainfall the Northern Division, but slightly more than normal ra fall elsewhere. Generally good growing weather with m haying accomplished, wheat harvest well under way, and ap cot picking started. Damaging storms were limited in tent; principal crop damage, estimated at $10,000 result from wind, rain and hail near McCammon at end of month.

AUGUST: Very dry with precipitation above long-peri mean at only a few stations. Temperatures averaged ne normal and sunshine above normal, except in north. Go month for crop growth, haying, and harvesting of grai No frost damage reported, although early morning temper tures dropped into the thirties during last week. One li lost by lightning strike at March Center, near Downey. Ha and other storm damage not extraordinary.

SEPTEMBER: Warm and very dry with sunshine well abo normal. Latter half of month particularly warm and dry wi only scattered very light amounts of rain reported. Gra harvest completed in all but a few late districts, pota digging well under way, pears and peaches picked, dry be harvest completed and harvest of seed crops begun under ve favorable weather conditions. Some fall planting done, b soil generally too dry. Pastures and lower ranges suffer from lack of moisture.

OCTOBER: Drought that began in mid-September contin throughout this month. Precipitation average was lowest 60 years of record. Temperatures well above normal and su shine far above the long-period mean. Potato and sug beet digging progressed very rapidly. Dry soil retard fall seeding; and, where earlier seeding had been acco plished, lack of moisture resulted in spotty stands grain.

NOVEMBER: One of the driest Novembers on record wi only 35% of long-period mean for the whole State. Also amo coldest Novembers on record with latter half particular cold. Sunshine again far above long-period mean. Weath permitted rapid completion of potato and sugar beet harvest but much fall plowing and planting was left undone becau of drought.

DECEMBER: Although much warmer than December 1951, t average temperature for the month was only a little abo the long-period mean. Precipitation for State averaged little above December mean, despite deficiency in Northe Division. Snowfall generally light below 3500 feet, but higher elevations many stations reported heavy snows; stat wide average about 30% above the 55-year mean. Cloudy ski and heavy fog cut sunshine well below normal. Number foggy days near all-time record in some areas. Little sto damage reported.

REFERENCE NOTES

Unless otherwise indicated dimensional units used in this bulletin are Temperature in °F, precipitation and evaporation in inches, and wind movement in miles Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4

The four digit identification numbers in the Index are assigned on a state basis There will be no duplication of numbers within a state

Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.

Figures and letters following the station name such as 12 SSW indicate distance in miles and direction from the post office

Delayed data and corrections will be carried in the June and December issues of Climatological Data

– No record

† Also later date (dates) or months.

• Amount included in following measurement

// Gage is equipped with a windshield.

B Adjusted to full month.

E Amount is wholly or partially estimated.

M Less than a complete month of record available; if average value is entered, less than 10 days of record are missing. See monthly Climatological Data for detailed daily record.

R Data from recording gage.

T Trace, an amount too small to measure.

V Includes total for previous months. V in annual column means total is for a two-year period.

S Storage precipitation station. Data will be published in the July or August or delayed data December issue of Climatological Data.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to Superintendent of Documents, Government Printing Office, Washington 25, D. C.

RELOCATIONS AND NAME CHANGES WILL BE FOUND ON PAGE 161

JANUARY 1953
Volume LVI No. 1

SAN FRANCISCO: 1953

IDAHO - JANUARY 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

January 1953 should long be remembered in Idaho for its mild, wet weather. In all of the 60 years of weather records no other January has been as warm. All sections of the State were affected, each division average exceeding that of any previous January, and the state-wide average topping previous records by three degrees. Many stations recorded new maximum temperatures for the month, particularly in the large valleys of the southwestern and south-central sections, and the 70° reading at Grand View on the 9th was the highest January temperature in the State since 1901.

Precipitation, averaged for the entire State, was nearly double the long-period mean for January. In 60 years only January 1909 has had more precipitation. The Northern Division in particular received extremely heavy precipitation, the average fall of 7.57 inches exceeding by more than an inch the previous Division high of 6.27 inches in January 1894.

Snowfall averaged close to the long-period mean for January, despite the fact that below an elevation of about 3500 feet amounts were generally small. Depths at higher elevations showed substantial increases during the month in most sections of Idaho, and density of the snow pack was above normal.

Sunshine was far below the January mean. Few Januaries have had so many days with precipitation and at several stations the greatest one-day precipitation amounts were new records for January. Strong winds occurred with more than usual frequency, but damage was comparatively light, being limited mainly to disruption of power and communications with only slight structural damage reported.

The unusually warm weather and abundanc of precipitation in Idaho during January 195 can be attributed to the persistence of lo pressure systems over the Pacific Northwes and over the eastern Pacific at middle an higher latitudes. Cold air masses, and thei attendant high pressure areas, generall moved southward east of the Continental Divide, while winds across Idaho were persistently from the west and southwest. Thu the State was under a maritime influenc throughout the month, except for two or thre minor invasions of continental polar air i the northern part of the State.

Within the almost constant flow of ai from the Pacific, fluctuations in intensit did, of course, occur. Two of the stormies periods during the month were from the 7t to the 9th and from the 16th to the 18th Most of the stations in the State recorde the heaviest precipitation of the month i either one or the other of these periods and in the earlier period a large number o stations reported high winds.

From the standpoint of the agricultura economy of Idaho, this month's weather wa generally beneficial. Rains at lower elevations moistened the soil which had so lon been dry. At intermediate and higher elevations rains served to increase the densit of the snow pack which still lies over dr ground in many areas. Streamflow was wel above normal for January, but reservoirs in general, held more water than usual fo this time of year. Prospects for irrigatio water supplies were good in most section with near-normal runoff indicated for mos of the major irrigation projects.

DJS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

FEBRUARY 1953
Volume LVI No. 2

SAN FRANCISCO: 1953

IDAHO - FEBRUARY 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Extremely mild weather, which had characterized the entire month of January, continued through the first week or more of February in Idaho. Much of the precipitation of the month occurred in this early period also, and as might be expected, percentage of possible sunshine was generally low during the first week or ten days. Averaging 8° warmer than a year ago, this February was the mildest since 1947, despite several days of subnormal temperature during the latter half. Individual station averages were, with one exception, above normal, with departures of 5° or more at a number of stations. Less precipitation was recorded, on the average, than in any February since 1947, yet the state-wide average was 89% of normal. Only the Southeastern Division showed a marked deficiency in precipitation, 56% of normal, although there were small areas in the other divisions where the total fall was also much below normal. The Wood River and Lost River drainage systems showed deficiencies, as did the Pend Oreille, the Weiser, part of the Coeur d'Alene Basin, and the Snake River drainage downstream to Grand View. Average snowfall for the State was little more than half as much as a year ago and about 75% of the long-period mean for February. In the principal valleys there was little snow cover at any time during the month, most of it melting within a day or two after it fell. No unusually severe storms occurred during the month, although strong winds were reported on several days.

The maritime influence on Idaho's weather, so predominant during January, persisted through the first week of February. Storm fronts moving eastward, crossed the State at intervals of about 36 hours, resulting in much cloudiness and rather prolonged periods of precipitation. Average daily temperatures ranged generally between 10° and 20° above normal until a storm center, forming on the final storm front in a long series, developed over Nevada and moved eastward. In its wake a ridge of high pressur developed along the Pacific Coast, extendin into western Canada and turning winds t northerly over Idaho on the 8th. Temperatures fell 10° to 20° generally, with man stations reporting even greater lowering o minimum temperatures within a two-day period Clearing skies contributed to this drop i nighttime temperatures and a number of stations in the southern divisions recorded th lowest temperatures of the month on the 10t and 11th. On the 9th and 10th the State wa almost entirely free from precipitation fo the first time in two weeks or more, but o the 11th light precipitation began again a a weak storm front moved across the Pacifi Northwest. The 15th through the 18th brough more widespread precipitation as anothe series of storm fronts from the Pacific swep eastward across the State. During the remainder of the month precipitation was generally very light and scattered. There was however, one final storm front that swep across the State on the last day of the month With it there was a general drop in temperature and widespread precipitation. In th Northern Division several stations reporte more than 3/4 inch of precipitation on th 28th, while in all sections there was snowfall at a number of stations.

Perhaps the most important features o the February weather, at least from the agricultural standpoint, were the appreciabl increase in the snowpack at higher elevation and the lowering of average temperatures during the latter half of the month. The coole weather served to retard development of vegetation, which had shown unseasonable activity during the extremely mild weather o several preceding weeks. Prospects were goo for adequate water supplies on most irrigation projects.

DJS

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

IDAHO

MARCH 1953
Volume LVI No. 3

SAN FRANCISCO: 1953

IDAHO - MARCH 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Temperatures continued above normal this month with individual station averages above normal for March at all but two or three points in the State. Positive temperature departures were particularly noticeable in the southeast where the division average was higher than in any March since 1947, and individual station averages were more than 5° above normal in several cases. Precipitation was below normal in all divisions, averaging 82% of normal in the Northern Division, 71% in the Southwestern, and only 57% in the Southeastern where the average March precipitation was the lowest since 1944. Despite the general deficiency of precipitation, however, cloudiness was more prevalent than usual for March and total sunshine was a little below the long-period mean. Snowfall, averaged on a statewide basis, was well below that of the past three years, but still a little above the 55-year mean for March.

Under the influence of a cold air mass that had moved into the State at the end of February, the weather remained cool and precipitation was widespread, though light, during the opening days of March. By the 4th temperatures had risen above normal and remained so for a week, reaching a peak on the 8th, 9th and 10th when afternoon readings from the middle fifties to the lower seventies were common. During the next ten days precipitation occurred rather frequently and temperatures were mostly a little below normal, as a series of storm fronts moved in from the Pacific and crossed Idaho. Most of the month's precipitation fell during this period and snow was reported even down to the lowest elevations between the 20th and 22d. The remainder of the month brought no unusual variations in weather and precipitation was light and scattered.

Agricultural activities were about normal for the season with considerable planting accomplished in lower valleys, but little field work done at higher elevations where the ground remained snow-covered until near the close of the month. Fruit was not damaged by freezing during March, although at the end of the month apricots were in bloom and cherry buds were swelling. Ranges and pastures showed little growth and cattle generally remained on feed lots, except in the warmer valleys. The outlook for sufficient irrigation water was good on nearly all projects.

No damaging storms were reported.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station,have been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

IDAHO

APRIL 1953
Volume LVI No. 4

SAN FRANCISCO: 1953

IDAHO - APRIL 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

For the first time since November monthly mean temperatures were below normal in Idaho. The statewide average temperature was 4° below that of April 1952, and damage from frost was more extensive than usual for the month. Precipitation was above normal in each of the three divisions of the State, in contrast to the deficiencies in March. The average precipitation for the State was more than double that of April 1952, yet it was only 120% of normal.

While all stations recorded average temperatures below the April normal, precipitation totals produced a rather erratic pattern of departures from normal. In the Northern Division all but a few stations reported totals in excess of normal and in the Salmon River drainage positive departures were general also. The principal negative departures occurred in the Weiser River Basin and in the easternmost counties of the State.

Snowfall was unusually heavy for April, averaging 222% of the 60-year mean for the State. Not since 1929 has the average snowfall exceeded five inches in April and only six times in 60 years has this month's average of 5.1 inches been exceeded. Sunshine over most of the State was below normal, as the number of rainy days for all stations averaged above the 60-year mean for April.

No damage from severe storms was reported in Idaho and no flooding occurred with the winter snowpack showing little sign of melting during the month.

Frost damage to fruits was extensive, particularly in the Southwestern Division. Nearly all apricots, which had reached full bloom early in the month, were killed; and damage to cherries was widespread in unheated orchards. Peaches in the Emmett and Sunnyslope areas were damaged to the extent of 50% or more of the potential crop. Some sugar beet fields in the Southwestern Division were thinned by frosts, necessitating replanting.

The cool weather retarded plant growth through much of the month and many raw, windy days hampered field work. Pastures and ranges were generally retarded; but during the third week of the month, and part of the fourth, generally dry and relatively warm weather brought a rapid increase in growth, as well as an increase in field work. Consequently, by the end of the month small grains had been planted in nearly all areas, except for high elevation areas in the east and in the wheat-growing lands of Nez Perce, Lewis and Idaho Counties. Sugar beets were growing well in southwestern counties and planting was well along farther east. Range forage was not up to normal and many cattle were still on feed lots, although at lower elevations they had generally been put on early pasture.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station,have been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

MAY 1953
Volume LVI No. 5

SAN FRANCISCO: 1953

IDAHO - MAY 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Unseasonably cool weather, which had begun in April, carried over through the month of May. The state-wide monthly average temperature of 48.6° was the lowest since 1933, and among the four lowest averages for May since 1893. Precipitation, although averaging 157% of normal for the State, has been heavier during May in a number of years. The number of days with measurable rain averaged higher than usual, while the state-wide snowfall average was also a little above the May mean. Sunshine appears to have been close to the seasonal normal in the extreme northern part of the State, but definitely below normal in the southern divisions where Boise recorded only 54% of possible and Pocatello 55%.

Positive departures from normal precipitation were recorded at all but a few stations in the State. The most notable exceptions were Porthill and Bonners Ferry where negative departures of approximately 3/4 inch appeared. Departures of +1.50 inches or more occurred at many stations in the Boise and Payette River Basins, with a few of similar magnitude scattered along the Snake.

During the first half of the month precipitation was comparatively light throughout the State, but even then temperatures were below normal on all but a few days. In the latter half of the month precipitation was both frequent and abundant while temperatures remained depressed below normal levels almost continuously throughout the period. The stormiest periods came between the 18th and 24th and again on the 28th and 29th. During these periods nearly every station in the State recorded its maximum daily precipitation for the month. At more than 20 stations the maximum daily amounts exceeded one inch, with a few approaching two inches.

The cool, wet weather hampered field work, delaying planting of spring grains in the Northern Division, planting of potatoes and thinning of beets in southern counties. The moisture was generally welcome on dryland grain fields and on ranges, which were in very good condition at the close of the month. Crop growth was generally considered slow and most crops were reported as not having attained normal development for the season. Nevertheless crop prospects appeared good despite some losses from frost during May. During the second week freezing weather struck particularly hard in south-central and southeastern districts where early fruits were hard hit; new alfalfa suffered as much as 50% damage and some sugar beets were lost.

Although May is normally a rather stormy month, storm damage during this month was not extensive. Hail on the 19th marked the prune crop in the Fruitland-New Plymouth area, and on the 21st and 22d, brief hailstorms near Mesa in Adams County did slight damage to pears which were in an early stage of development. Strong winds on the 21st uprooted some trees and did minor structural damage near McCammon, while a small whirlwind did similar damage near Shoshone during the final week.

The snowpack remained unusually heavy at the close of May and little increase in streamflow from snowmelt was observed by the end of the month. Irrigation practically ceased with the copious rains of late May and on most projects reservoir storage was high with prospects of more than ample water supplies for the summer.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this letin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be cluded in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporatio inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the stan Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the tion Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on gr values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summar Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regard subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

IDAHO

JUNE 1953
Volume LVI No. 6

CHATTANOOGA: 1953

IDAHO - JUNE 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Temperatures averaged much below normal in the Northern and Southwestern Divisions, placing this among the three or four coolest Junes since 1893. In the Southeastern Division negative temperature departures were not so pronounced and a few stations in that Division recorded average temperatures slightly above the long-period mean. In all divisions subnormal temperatures persisted throughout the month, except for an occasional day or two with above normal readings.

Precipitation, as in June of 1952, was well above normal this month. In fact, in the Southwestern and Southeastern Divisions, averages were nearly identical for the two months. The Northern Division with 110% of normal dropped well below the near-record average of 186% of normal a year ago. Frequency of occurrence of measurable rain was just about average for June, but most of the rain fell in the first half of the month; stations in the Southwestern and Southeastern Divisions reported little or none after the 16th. No station reported more than a trace of snow, and although hail did occur on several days, most of it was small and did little damage.

Outstanding rainy periods during the month occurred on the 1st and 2d, and on the 6th and 7th. A majority of the stations in the State recorded the greatest daily rainfall on either the 2d or the 7th and numerous thunderstorms were reported on those dates, particularly in the Northern and Southwestern Divisions. Another day of widespread showers and thunderstorms was the 12th, and on that date the only storm damage of the month was reported. In several southwestern counti high winds were reported with numerous tre damaged or uprooted and minor damage to roo from falling trees. No damage to crops w reported from the high winds.

Wet, cool weather during the first ha of June retarded farm work and general slowed crop growth, but range vegetati benefited from the moisture. Haying, bee thinning, cultivating, and the planting beans and potatoes were all hampered by w weather. In some spots in the Northern a Southeastern Divisions the seeding of spri grains was not completed until well alo in the month. During the latter half of t month field work increased considerably a vegetation began growing rapidly. By t final week of June irrigation had been r sumed in most areas, intermediate and high ranges had good feed, and cattle and shee were making good gains. Prospective fru production was below average with heavy da age from spring freezes to peaches, aprico and cherries, and minor damage to pears a early blooming varieties of apples. Co weather permitted grains to stool well a the rains of May and early June increas yield prospects.

Although much snow remained in the mou tains early in June, no serious floodi occurred despite above-normal rains. Absen of prolonged hot spells permitted gradu runoff from melting snow and streams gene ally remained well within their banks. I rigation water supplies were plentiful all projects.

DJS

e four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will no duplication of numbers within a state.

gures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

servation times given in the Station Index are in local standard time.

layed data and corrections will be carried only in the June and December issues of this bulletin.

nthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bultin.

ations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be inuded in this issue.

less otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in ches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard ather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

eet and hail were included in snowfall averages in Table 1, beginning January 1949.

ounts in Table 3 are from non-recording gage, unless otherwise indicated.

ta in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Staon Index for observation time.

ow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground lues are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is asured at selected stations when the depth of snow on the ground is two inches or more.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

And also on a later date or dates.

Amounts included in following measurements, time distribution unknown.

Gage is equipped with a windshield.

This entry in time of observation column in Station Index means after rain.

Adjusted to a full month.

Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

Daily precipitation values and monthly total from recording gage.

Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

This entry in time of observation column in Station Index means sunset.

Trace, an amount too small to measure.

Includes total for previous month.

This entry in time of observation column in Station Index means variable.

scription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) cks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding scriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTED DATA

UARY 1952	SAINT ANTHONY:	Delete precipitation departure.
UARY 1952	ELK CITY:	Delete no record 19th through 28th. Add accumulation (*) on 22nd and 28th. Monthly total should be accumulation (*) and days with .01 or more 13.
P L 1952	COEUR D'ALENE RS:	Total snowfall should be Trace.
UST 1952	KUNA 2 NNE:	Highest temperature for month should be 93° on 3rd and other days.
EMBER 1952	HOLLISTER:	Precipitation departure should be -.46
	PAUL 1 E:	See Delayed Data for Table 2 and 5. Record was omitted from the monthly Climatological Data.
C'BER 1952:	HAILEY:	Precipitation departure should be -1.11.
O'MBER 1952	HILL CITY:	Precipitation departure should be -.62.
MBER 1952	GLENNS FERRY:	Precipitation departure should be -.45.

IDAHO

JULY 1953
Volume LVI No. 7

CHATTANOOGA: 1953

IDAHO - JULY 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

With precipitation averaging only 20% of normal for the State as a whole, this July was the driest in the 61 years of record for Idaho. Only twice has the Northern Division average been lower in July, while in the Southeastern Division this month has been drier in only five years. No previous year since 1893 brought such light July precipitation to the Southwestern Division, where this year the average monthly total for 47 stations was only 0.02 inch. In all of the State there were only five stations where showers produced above-normal totals for the month, and 42 stations in the State reported no rain at all.

Temperatures averaged above normal in the Southeastern and Southwestern Divisions and below normal in the Northern Division, but departures were relatively small. The extreme temperatures of 111° at Kooskia on the 12th, and 27° at two stations on the 16th, were not extraordinary for July, but the persistence of high temperatures for several days in the first half of the month produced a rather uncomfortable spell.

Sunshine, nearly always abundant during July, exceeded normal, as all stations in the State averaged only one day during the month with measurable rain.

The dry weather was a boon to farmers in putting up hay crops, harvesting of early grains, peas and fruits. Lack of moisture, however, adversely affected grains on dryland farms and the hot spell early in the month diminished the potential yield of spring grains in the Northern Division. In some areas growers were unable to irrigate potatoes sufficiently and rough potatoes were expected as a result. Summer ranges suffered from lack of moisture, and forest and range lands generally reached a critical burning stage during the month. The relatively small number of thunderstorms, however, kept fires at a minimum, although several small fires did start from lightning and one burned about 1,000 acres in the Challis National Forest. Sugar beet thinning and cultivation were completed early in the month and some summer-fallow plowing was accomplished, despite drying topsoils.

No severe storm damage was reported in the State, either from wind or from hail.

DJS

e four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will
no duplication of numbers within a state.

igures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

servation times given in the Station Index are in local standard time.

layed data and corrections will be carried only in the June and December issues of this bulletin.

nthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bul-
tin.

ations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be in-
uded in this issue.

less otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in
ches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard
ather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

eet and hail were included in snowfall averages in Table 1, beginning January 1949.

ounts in Table 3 are from non-recording gage, unless otherwise indicated.

ta in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Sta-
on Index for observation time.

ow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground
lues are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is
asured at selected stations when the depth of snow on the ground is two inches or more.

ter equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; conse-
ently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Nc record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

And also on a later date or dates.

Amounts included in following measurements, time distribution unknown.

Gage is equipped with a windshield.

This entry in time of observation column in Station Index means after rain.

Adjusted to a full month.

In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

Daily precipitation values and monthly total from recording gage.

Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

This entry in time of observation column in Station Index means sunset.

Trace, an amount too small to measure.

Includes total for previous month.

This entry in time of observation column in Station Index means variable.

scription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.)
cks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding
scriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

AUGUST 1953
Volume LVI No. 8

CHATTANOOGA: 1953

IDAHO - AUGUST 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Although state-wide average precipitation this month was considerably higher than in August 1952, it was still a little below normal. The Northern Division average was far above that of a year ago, but in the Southeastern Division the average was below 1952, and only 52% of normal. Temperatures averaged near normal in all divisions and the extremes (109° at Grand View on the 12th and 22° at Three Creek on the 25th) were rather typical of August. Although there was no long period of extremely hot weather during the month, temperatures ran rather consistently above normal from the 12th through the 19th. On the other hand, the week from the 24th through the 30th brought below-normal temperatures to the Northern and Southwestern Divisions.

On the basis of available records, sunshine appears to have been generally below the August mean in the north and southwest, but above average in the southeast. The average number of rainy days per station throughout the State was four, a little above normal, but not up to numbers of such days reported in August 1951 (6) and August 1941 (9).

As is typical of August weather in Idaho, few storm fronts crossed the State and they were generally weak. Two fronts during the last week, however, served both to lowe the temperatures and to increase shower activity, particularly in the Northern and Southwestern Divisions. Neither of these stor fronts was accompanied by destructive wind or hail, but some damage to crops, tree and roads did occur between the 1st and 3 in thunderstorms at such widely separate places as Grand View, Oakley and McCammon.

Lightning storms in forested areas occurred with sufficient frequency to create som problems in fire control, but most fires wer suppressed before covering more than a smal area. Several did, however, burn from 100 t 800 acres. There were also numerous rang fires, several covering more than 1,00 acres.

For the most part the weather was favorable for plant growth and for all agricultural activities during the month. Grai and hay harvesting progressed rapidly wit only minor delays from showers, mostly i the Northern Division. Sugar beets and potatoes grew well, peas and beans mature nicely through most of the month and peache were nearly ready for harvesting by the en of the month. Lack of sufficient rainfal adversely affected grains on dryland farm of the Eastern Division and resulted in extremely dry conditions on summer ranges.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

And also on a later date or dates.

Amounts included in following measurements, time distribution unknown.

Gage is equipped with a windshield.

This entry in time of observation column in Station Index means after rain.

Adjusted to a full month.

In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

Daily precipitation values and monthly total from recording gage.

Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

This entry in time of observation column in Station Index means sunset.

Trace, an amount too small to measure.

Includes total for previous month.

This entry in time of observation column in Station Index means variable.

ubscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) hecks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding ubscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CHATTANOOGA: 1953

IDAHO - SEPTEMBER 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

For the second successive year September was a warm, dry month in Idaho. The state-wide average temperature, as in 1952, was 3.3° above normal while precipitation averaged even lower than last year. With a state-wide average of only 0.18 inch this September was drier than all but two in the 61 years for which we have records; in 1943 and 1932 the average was 0.15 inch. About one-third of the Southwestern Division stations reported no rain or only traces for the month, and the same was true of several stations in the Southeastern Division. Only one station in the State recorded above-normal precipitation, and that was Grand View, in Owyhee County, where a shower on the afternoon of the 16th produced 0.67 inch of rain.

The relatively cool weather of the final week in August carried over into the first few days of September. Thereafter, however, for ten days or more, the daily temperatures ran consistently above normal while precipitation was confined to light, scattered showers. Few storm fronts crossed the State during the first half of the month and they were weak and generally dissipating as they moved into Idaho. Several significant storm fronts passed across the State during the latter half of the month, beginning with a cold front that moved from northwest to southeast on the 16th and 17th, accompanied by rather widespread showers in southern sections and temperature drops of some 20° in all areas. A cold front that moved across the State on the 19th was weak and affected Idaho's weather but slightly. Another on the 23d and 24th brought cooler weather lasting about four days. A cold front, moving rapidly from the extreme north to the southeast corner of the State in about 18 hours on the 28th, brought showers and lower temperatures to the Northern and Southwestern Divisions, but its effect on the weather of the Southeastern Division was slight. Aft two days of cooler weather temperatures ro rapidly to well above normal on the 30t That evening, however, another cold fro entered the northwest corner of the Sta and by midnight it had progressed to a li approximately from Missoula to Boise. Thu as the month drew to a close, cooler ai accompanied by showers, was again invadi the State.

The effect of September's weather on t agricultural economy of the State was, the whole, fairly beneficial. Harvesti of grains progressed with little delay fr rains, final hay cuttings were made, bea were permitted to mature and threshing b gan under favorable, dry conditions. Fro on the morning of the 4th, and again on t 18th, did little damage except to garde in higher valleys. Many stations did n report subfreezing temperatures until t final week and even then most of the lowe elevation areas remained unaffected. La of moisture was a deterrent to fall plowi and seeding, yet some grain was planted spite of the dry soil. Potato harvesti had started in some areas by the end of t month, but in many fields digging awaited freeze to kill the vines. Sugar beet di ging began late in the month and factori were in operation. Ranges were general very dry, particularly at higher elevation and some cattle were moved to lower pastur during the month. Fire hazard on forest a range lands remained high for the seaso but because of the relatively small numb of lightning storms fire damage was rath low. At one time, however, the Boise Natio al Forest had 12 fires, following the thu derstorm activity that accompanied the co front of the 16th and 17th, but the follo ing cool spell helped in bringing the fir under control rather quickly.

REFERENCE NOTES

he four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will e no duplication of numbers within a state.

igures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

bservation times given in the Station Index are in local standard time.

elayed data and corrections will be carried only in the June and December issues of this bulletin.

onthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bul-etin.

tations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be in-luded in this issue.

nless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation in nches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard eather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

leet and hail were included in snowfall averages in Table 1, beginning January 1949.

mounts in Table 3 are from non-recording gage, unless otherwise indicated.

ata in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Sta-ion Index for observation time.

now on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground alues are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is easured at selected stations when the depth of snow on the ground is two inches or more.

ater equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; conse-uently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

And also on a later date or dates.

Amounts included in following measurements, time distribution unknown.

Gage is equipped with a windshield.

This entry in time of observation column in Station Index means after rain.

Adjusted to a full month.

In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

Daily precipitation values and monthly total from recording gage.

Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

This entry in time of observation column in Station Index means sunset.

Trace, an amount too small to measure.

Includes total for previous month.

This entry in time of observation column in Station Index means variable.

ubscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) hecks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding ubscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CHATTANOOGA: 1953

IDAHO - OCTOBER 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Although neither as warm nor as dry as October 1952, this month again had above normal temperatures and marked deficiencies in precipitation. Aside from 1952, only three other Octobers were drier than this month which had state-wide average precipitation of only 0.48 inch, as compared to a 61-year mean of 1.41 inches. Of particular interest, also, is the repetition of two successive dry months, as in 1952. This combination of a dry September and a dry October for the whole State has occurred only a few times since 1893.

With few exceptions, stations throughout the State reported average temperatures above the October mean for the period of record. Precipitation totals at individual stations were generally well below the October mean, except at a half-dozen stations in the south central part of the State. Sunshine was well above normal for the month, although not as abundant as in October 1952, when an estimated 85% of possible was observed.

A cold front, which on the evening of September 30th had moved through the Northern Division and part of the Southwestern Division, continued rather slowly southeastward on October 1st, finally passing beyond Idaho's eastern boundary about midnight. The invasion of colder air was accompanied by showers and, when skies cleared, a hard freeze resulted in most areas by the morning of the 3d. Thereafter, for a week, a large area of high pressure dominated the weather pattern over the western states, blocking eastward movement of Pacific storm fronts as temperatures rose to levels some 8° or 10° above normal. On the 10th a fast-moving front did cross the State, but no precipitation of consequence occurred, although temperatures dropped several degrees. Between the 14th and 24th several showery periods occurred, particularly in the Southwestern and Southeastern Divisions, and temperatures were generally below normal. The final week of October brought warmer weather with precipitation limited to the Northern Division, where showers occurred on the last three days of the month.

Agricultural activities were generally favored by the warm, dry weather. The dry weather of September, coupled with the fine weather of this month, permitted full development of potatoes, sugar beets and beans. Following the hard freeze early in the month, potato digging went forward rapidly and beans were threshed under favorable conditions with yields better than anticipated. Quality of late potatoes was good, although still below the high quality crop of 1952. Dry beans included more than the usual amount of dirt due to the condition of the soil at harvest time, but quality was generally very good. Sugar beets ranked high both in tonnage and sugar content. There were, nevertheless, some unfavorable aspects of the warm dry autumn. Pastures were far below average for the season and fall seedings were delayed because of the dry soil conditions, with some seeding done in soils that were literally dust.

The season of moderate fire hazard in forest and range lands continued well into October and numerous man-caused fires were reported. Nearly all of these were suppressed before they could spread over more than a few acres.

No severe storms were reported during the month and extreme winds, as reported by first-order Weather Bureau stations, were unusually light for October.

DJS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There
be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this
letin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be
cluded in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporatio
inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the stanc
Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the S
tion Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on gro
values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It
measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; co
quently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the rec

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are proce ed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

IDAHO - NOVEMBER 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

In contrast to November 1952, which was unusually dry and cold, this month showed relatively slight precipitation deficiencies in most sections of the State while temperatures averaged 10° higher than last year. The average precipitation was 96% of normal in the Northern Division, 86% in the Southwestern Division and 52% in the Southeastern Division. In November 1952 the respective Divisions recorded average precipitation of 22%, 36% and 65% of normal. The statewide average in November 1952 was 35%, compared to 85% in the current month. Average temperatures this month at individual stations ran from 2° to 8° above normal, placing this among the warmest Novembers on record for Idaho and a full 10° warmer than a year ago.

As might be expected with above-normal temperatures, much of this month's precipitation fell as rain, giving us a statewide snowfall average of little more than 50% of normal. One point of particular interest here is, that although the snowfall was somewhat heavier than in the extremely dry November of 1952, the contrast in temperatures resulted in a smaller mountain snowpack at month's end than a year ago. Sunshine was somewhat less than normal, while winds averaged above the mean of past years.

Precipitation occurred with about normal frequency, although during the first half of the month the Southeastern Division had only one two-day spell of widespread showers. Storm-front systems had comparatively little effect on Idaho weather during the first half of the month, although a cold front did sweep southeastward across the State between noon of the 1st and early morning of the 2d, and another weak cold front moved more slowly eastward on the 5th and 6th. Temperatures fluctuated about the normal during the first few days of the month, but were continuously above normal in all divisions from the 7th through the 16th. The persistence of a high pressure cell over Utah and Colorado, while low pressure centers moved northward just off the Pacific Coast, resulted in a predominance of southerly winds aloft, and hence the importation of warm air into the State.

A cold front that moved eastward across the Pacific Northwest on the 16th and 17th, was the first of a series of fronts that ushered in a change of pattern. For the remainder of the month the more normal westerly winds persisted over our region and storm fronts from the Pacific passed across the State with considerable regularity. Each frontal system brought its period of precipitation; yet, except for a few cool days following the first front in the series, temperatures remained above normal until the end of the month.

The warm weather was generally favorable to the agricultural economy of Idaho, permitting completion of sugar beet and potato digging, and improving range and pasture conditions where rains were sufficient. Grain which had been sown in very dry soil in the Southeastern Division, responded to the warmth when moisture came, and reports from the Northern Division indicated good stands of winter wheat. Cattle and sheep were in somewhat better condition than at the end of October, but still a little below average for this time of year.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There w be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bu letin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be i cluded in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standa Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the St tion Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on grou values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; cons quently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the rec

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are proces ed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of r snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, ha been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

IDAHO

DECEMBER 1953
Volume LVI No. 12

CHATTANOOGA: 1954

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

The average temperature for the State as a whole was very nearly the same as in December 1952, but by divisions the Northern showed a rise of two degrees from last year while the Southwestern and Southeastern were one degree colder. Precipitation was somewhat lighter than last year for the entire State, yet in the Northern Division there was a substantial increase to 120% of normal for the month. The Southwestern and Southeastern Divisions were considerably drier than a year ago, however, averaging 72% and 68% of normal, respectively. The average snowfall was lighter than in December 1952, but just about equal to the 56-year mean for the month. Based on the average of all stations, the number of days with measurable precipitation was above the long-period mean and sunshine, based on records from Boise, Pocatello and Spokane, Washington, fell short of the December normal.

The greatest precipitation deficiencies during the month were generally in the drainage basins of the Boise, Payette, Weiser and Wood Rivers. These deficiencies, following the general lack of moisture during the autumn months, resulted in sub-normal snow cover over the southern and central portions of Idaho. Precipitation for the period from October 1st through December has been particularly light in the upper portions of the Snake River drainage and in the Bear River drainage lying within our State.

The early part of the month brought much cloudy weather and frequent precipitation to the State. During the first ten days of the month precipitation occurred daily in all sections. During the remainder of the month precipitation was neither so widespread nor so frequent, but there were two shorter periods (18th to 20th and 25th to 28th) when rain or snow occurred at numerous stations in all divisions.

Agriculturally the relatively mild December weather was favorable for such work as can be accomplished at this season. The abundant December precipitation in the Northern Division resulted in considerable improvement in winter ranges, but elsewhere there was little change. For the State as a whole the average range condition was below normal, but still above the very low condition of a year ago. The open weather that permitted grazing on winter ranges, plus the supplemental feeding, resulted in general improvement during the month in the condition of cattle and sheep. More cattle were being fed for market than a year ago, but the number of sheep and lambs being fattened was considerably smaller. Fall seeded wheat generally was in better condition than a year ago, although still below average. The poorest condition was reported in the eastern part of the State.

No damaging storms were reported in December and delays in movement of highway and rail traffic due to snow and ice were less than usual. Heavy fog occurred on more than the usual number of days, but no serious accidents were reported as a result of the fog.

DJS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There wi be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bu letin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be i cluded in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F, precipitation and evaporation inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standa Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the St tion Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on grou values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; cons quently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the reco

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are proces ed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, h been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summar Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding s scriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTED DATA

FEBRUARY 1953		The following list of stations were omitted from the published Climatological Data Tabl Avery RS, Bayview Model Basin, Big Creek 1 S, Bonners Ferry 1 SW and Burke 2 NNE. See layed Data Table 2 for published record.
JUNE 1953	PIERCE RS:	Max. temperature on 29th should be 86°, mean max. 68.3°, mean 53.8°, departure -3.9°, h est for month 86° on 29th, and total degree days 331.
	BIG CREEK 1 S:	Precipitation on 2nd should be .07, monthly total 1.39, departure -1.19, greatest day . on 12th and days with .01 or more 13.

ANNUAL SUMMARY 1953

Volume LVI No. 13

CHATTANOOGA: 1954

IDAHO - ANNUAL - 1953

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Average monthly temperatures in all sections of Idaho during 1953 showed a markedly different pattern than in the preceding year. The first quarter, with January averages the highest on record, was very mild in contrast to the cold weather during the same period in 1952. The second quarter also showed a reversal with temperatures well below normal during April, May and June of this year. September and October were similar in the two years, with average temperatures above normal, but where temperatures plunged well below normal in November 1952 they continued above normal during that same month in 1953. The annual average temperature for the State this year was 2.2° higher than in 1952 and 1.6° above normal.

Precipitation for the year averaged a little above normal in the Northern and Southwestern Divisions, but the Southeastern Division average was only 80% of normal. Much of the excess in the Northern Division resulted from the unusually heavy falls in January, while in the Southwestern Division the principal excesses occurred in January and May. In the Southeastern Division the monthly averages were continually below normal during the last six months of the year. Snowfall, which reached unprecedented levels in some parts of the State during the winter and spring of 1952, was considerably lower in 1953. That, together with gradual warming during the spring months, resulted in runoff without major floods, such as those of the preceding spring.

Despite a cool, wet spring which gave a late start to most vegetation, production of several crops was the largest of record. In this category were all wheat, all hay, corn, dry beans and sweet corn. Oats, potatoes, sugar beets, hops, alfalfa seed, red clover seed, ladino clover seed and green peas showed above-average production, but below-average production was reported for barley, rye, dry peas, alsike clover seed, white clover seed, Austrian winter peas, all fruits and all truck crops.

The very dry fall of 1952 gave fall-sown crops one of the poorest starts in the history of the State, but the mild winter weather and above normal rainfall allowed some 1953 crops to come through better than expected. Irreparable damage was done to alsike and white clover seed and to Austrian winter peas and much winter wheat was abandoned in southern sections, but most of it survived in the northern part of the State. Spring frosts cut production of most fruits, with peaches hurt severely and apricots practically a total loss. Development of field crops was later than usual during most of the summer, following the late spring and its attendant delays in planting, but the extremely favorable fall weather allowed potatoes, corn, dry beans and sugar beets to mature fully. Harvest of nearly all crops was completed with a minimum of weather loss.

As in 1952, dry soil in the fall months hampered the seeding of fall grains, and in the Southeastern Division some wheat was planted in soils that were literally dust. Precipitation in late October and November was beneficial, however, and the crop generally was in much better condition on December 1st than on that date a year earlier. Nevertheless, the condition of the fall-sown grains was below average and in the Southeastern Division the condition of much of the crop was poor.

Thunderstorms were numerous in August, but in July and September they were rather infrequent and scattered. Forest and range fires were more numerous than usual, but acreage burned was not excessive. Damage from storms was relatively light during the year with hailstorms reported only at scattered points during the summer. No loss of life was attributed to weather elements.

SYNOPSIS BY MONTHS

JANUARY: Warmest January on record in Idaho with precipitation nearly double the 60-year mean for the State and heaviest since 1909. Snowfall was generally light below elevation of about 3500 feet, but at higher elevations snowpack increased substantially and density was above normal. Strong winds occurred on a number of days with relatively light damage reported.

FEBRUARY: Averaging 8.1° warmer than the preceding year this was the warmest February since 1947, despite several days of subnormal temperatures during the latter half of the month. State-wide average precipitation wa 89% of normal but in the Southeastern Division the average was only 56%. Cooler weather latter half of mont retarded vegetation which had shown unseasonable activit during mild weather of several preceding weeks.

MARCH: Average temperatures were above normal again with positive departures particularly noticeable in th Southeastern Division. Precipitation was below norma with the Southeastern Division average only 57% of normal. Considerable planting was done in lower valleys bu higher elevations remained snow covered. No frost damag to fruits was reported although apricots were in bloo and cherry buds were swelling by the end of the month.

APRIL: Monthly average temperature was below norma for the first time since November. Frost damage was mor extensive than usual for April; nearly all apricots wer killed and damage to cherries was extensive. In som orchard areas peaches were damaged to the extent of 50 or more of the potential crop. Frost also thinned som early sugar beet stands, necessitating replanting. Precipitation was above normal in all divisions and averag snowfall for the State was more than 200% of the 60-yea mean for April.

MAY: Cool weather continued through this month wit state-wide average temperature the lowest since 1933 Precipitation averaged 157% of normal and snowfall was little above average for May. Field work was hampered b wet weather, but the moisture was welcome on dryland farms Freezing weather during the second week did considerabl damage to early fruits and to new alfalfa in south centra and southeastern districts. The snowpack remained unusually heavy at the close of the month and the increase i streamflow during the month was below average.

JUNE: A cool, wet month which further retarded far work, but benefited range vegetation. Haying, beet-thinning, cultivating and the planting of beans and potatoe were all delayed, but as precipitation became more scattered during the latter half of the month, field work increased and vegetation began growing rapidly. Despite large mountain snowpack there was little flooding durin the month.

JULY: Although the month was extremely dry and sunshine more than usually abundant, the average temperatur for the State was only slightly above normal. In th Southwestern Division precipitation averaged only 0.0 inch for 47 stations, the lowest in 61 years of record The dry weather was a boon to farmers in putting up ha crops and harvesting early grains, peas and fruits.

AUGUST: Temperatures averaged near normal in all divisions while precipitation was 157% of normal in th north, near normal in the southwest and only 52% of normal in the southeast. Grain and hay harvesting progresse rapidly except for minor delays from showers in the Northern Division. Lack of moisture adversely affected grain on dryland farms in the east and resulted in extremel dry conditions on summer ranges. Storm damage was ligh but numerous small forest fires were caused by lightnin and several range fires burned more than 1,000 acres each

SEPTEMBER: Warm and dry with average temperature mor than 3° above normal and average precipitation only 0.1 inch, making this the third driest September in 61 year of record. Harvest activities progressed with littl delay during the month, but lack of moisture hampered fal plowing and seeding. Frosts on mornings of 4th and 18t did little damage except in higher valleys. Sugar bee digging began late in month. Ranges remained very dry.

OCTOBER: Another warm, dry month with abundant sun shine. No severe storms were reported and final harvesting of crops was accomplished under favorable conditions Hard freeze early in month killed potato vines and digging of late varieties went forward rapidly. Pasture were far below average for the season and fall seedin suffered further delays because of dry soil.

NOVEMBER: Another warm fall month, but with smalle precipitation deficiencies than in October and Septembe Southeastern Division, however, still received an averag of only 52% of normal precipitation. Sugar beet and pota to harvests were completed and, where moisture was suffi

RELOCATIONS AND EQUIPMENT CHANGES

BONNERS FERRY	All equipment moved 2 miles S.	September 27,	1953
BURLEY FACTORY	Recording rain gage equipment installed.	January 27,	1953
BURLEY CAA AP	Recording rain gage equipment removed. .	January 27,	1953
CAMBRIDGE	All equipment moved 0.5 mile N	September 17,	1953
CASCADE 1 NW	Recording rain gage equipment installed.	September 15,	1953
COUNCIL 1 N	All equipment moved 0.5 mile S	April 1,	1953
FAIRFIELD	All equipment moved 0.3 mile SE.	June 6,	1952
HAILEY	All equipment moved 0.3 mile SSE	June 1,	1953
MERIDIAN 1 SSW	All equipment moved 1 mile WNW	July 1,	1953
OLA 4 S	All equipment moved 0.5 mile S	September 14,	1953
POTLATCH	All equipment moved 1.2 miles SE	September 23,	1953
SPRINGFIELD	All equipment moved 1 mile SE.	June 1,	1953

CHANGES IN STATION NAMES

BONNERS FERRY	Changed to	BONNERS FERRY 1 SW	September 27, 1953
COUNCIL 1 N	Changed to	COUNCIL	April 1, 1953
FAIRFIELD	Changed to	FAIRFIELD RS	June 6, 1952
HAILEY	Changed to	HAILEY AP	June 1, 1953
MERIDIAN 1 SSW	Changed to	MERIDIAN 1 W	July 1, 1953
OLA 4 S	Changed to	OLA 5 S	September 14, 1953
PINE 2 SSW	Corrected to	PINE 2 S	November 1, 1953
POTLATCH	Changed to	POTLATCH 1 SE	September 23, 1953
SPRINGFIELD	Changed to	SPRINGFIELD 1 SE	June 1, 1953

WEATHER SUMMARY (Continued)

cient, pastures and ranges showed improvement. Cattle and sheep were in better condition that at the end of October, but still below average for the season. Good stands of wheat were reported in the Northern Division.

DECEMBER: Average temperatures were again above normal with precipitation averaging 120% of normal in the Northern Division, and about 70% of normal for the remainder of the State. Greatest precipitation deficiencies were in the Boise, Payette, Weiser and Wood River drainages. Snow cover was below normal in the southern and central portions of the State. Winter ranges improved in the Northern Division and there was general improvement in the condition of cattle and sheep during the month. Several mountain passes normally closed to travel at this time of year remained open.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

- No record.
+ Also later date (dates) or months.
• Amount included in following measurement.
/ Gage is equipped with a windshield.
B Adjusted to full month.
C Data for recorder stations denoted by 'C' are processed for special purposes and published in "Hourly Precipitation Data". Length of record for recorder-only stations may be found in the annual issue of "Hourly Precipitation Data".
E Amount is wholly or partially estimated.
M Less than a complete month of record available, if average value is entered, less than 10 days of record are missing. See monthly Climatological Data for detailed daily record.
R Data from recording gage.
T Trace, an amount too small to measure.
V Includes total for previous months. V in annual column means total is for a two-year period.
S Storage precipitation station. Data will be published in the July or August or delayed data December issue of Climatological Data.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to Superintendent of Documents, Government Printing Office, Washington 25, D. C.

RELOCATIONS AND NAME CHANGES WILL BE FOUND ON PAGE 159.

CHATTANOOGA: 1954

IDAHO - JANUARY 1954

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

For the fifth consecutive month the average temperature was above normal in all divisions of the State. In the Southwestern and Southeastern Divisions the averages were among the four or five highest for January in 61 years of record, although still nearly 6° lower than in the record-breaking January of 1953. An outbreak of Arctic air covered the Northern Division for a week or more near mid-month, and consequently the average temperature for the month was only a little above normal.

Precipitation averaged well above normal in the Northern and Southwestern Divisions; in fact, the January average for Northern Division has been exceeded only in 1894 and 1953. The Southeastern Division, however, averaged only 82% of normal, making this the seventh successive month with subnormal precipitation in that Division. A few Southeastern Division stations, however, did report precipitation totals that exceeded normal, notably Island Park Dam, several stations from Lifton northward to Gray, and some stations in Butte and Custer Counties. The principal deficiencies occurred along the Snake River downstream to Weiser. Excesses of precipitation were large in all of the Northern Division, except a sizable part of the Clearwater Basin, and in the Weiser, Payette, Boise and Wood River drainages.

The early part of the month brought little precipitation to Idaho while temperatures generally were well above normal. On the 14th, however, a slow-moving cold front entered the extreme northern portion of the State, bringing rapidly falling temperatures and heavy snow. Porthill reported 24 inches and Bonners Ferry 14 inches of snow within 48 hours. For about the next 10 days this Arctic front advanced and retreated in irregular fashion across several northern counties. Another period of heavy snow occurred on the 17th and 18th with amount ranging up to 14 inches at Priest River an Sandpoint, and 16-1/2 inches at Wallace an Porthill. During the next two days the col air pushed southward to the southern boundar of the State, but on the 21st and 22d th cold front retreated northward under th onslaught of warm moist air pouring inlan in advance of a storm center. The interaction of the two markedly different air masse resulted in some of the heaviest snows o the month from Adams and Valley Countie northward. Winds were strong on severa days during the period of snow and col weather in the Northern Division, with drift intermittently blocking roads and railways In some localities power and telephone line were broken; and near Wallace, where snowslides added to the difficulties, portion of trains were derailed on at least two occasions. Minor traffic accidents were numerous.

Increases in snow depth at reporting stations in the Northern Division totaled a much as 3 to 4 feet during the 10-day perio beginning on the 14th, and in the mountainous areas of the Southwestern Division th water content of the snowpack increased t well above the average of past years, wherea a month earlier depths were generally wel below average. Sub-zero temperatures wer common in the Northern Division on at leas 2 or 3 days, reaching -23° at Potlatch, -24 at Priest River, -27° at Porthill and -30 at Dixie.

No reports were received of lives los because of weather elements during the sever weather in mid-month, and apparently livestock survived in good condition. No estimates of property damage have been made, bu such damage appears to have been confine mainly to power and communications lines.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There wil be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation i inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standar Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effectiv January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on groun values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the recor

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of ne snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, hav been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July c August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary. Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

FEBRUARY 1954
Volume LVII No. 2

CHATTANOOGA: 1954

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

With temperatures above normal in all sections of the State for the sixth consecutive month, this was one of the warmest Februaries on record in Idaho. Not since 1934 has the state-wide average temperature for the month exceeded this year's 34.0°, which was higher by 2.5° than the average for February 1953. Precipitation was below normal in all divisions, although several stations in the area north of the St. Joe River, and others at higher elevations in central Idaho, reported greater than normal totals. Deficiencies were especially marked in the Clearwater Basin, along the Snake River, and in most of the Boise River Basin. The Southeastern Division averaged only 57% of normal, making this the eighth consecutive month with subnormal precipitation in that Division.

During the first ten days of the month the dominant influence on Idaho's weather was the persistent high pressure system over the Inter-mountain Region. Stable air with light winds and widespread fog, but little or no precipitation, characterized this period. The following ten-day period showed a marked contrast to the earlier part of the month. Winds were well above average and precipitation occurred almost daily as storm fronts crossed the State in rapid succession. Because of the predominance of southwesterly winds aloft during this period, the weather was generally mild even though persistent cloudiness reduced sunshine below what normally might be expected. The final days of the month brought a continuation of windy conditions, but precipitation was light and scattered, while temperatures remained generally above normal and sunshine increased

Despite precipitation deficiencies at a majority of reporting stations this month the accumulated snowpack was, in most parts of the State, normal or above. Snow surveys near the end of February indicated water content of the snowpack below normal south of the Snake River, near normal from the Snake northward to the Salmon River and well above normal over the northern part of the State

Range feed had an early start due to the mild weather of February, although range conditions were still not good in some lower areas where prolonged lack of moisture was apparent. Generally, however, cattle and sheep were in very good condition and calving and early lambing were proceeding very well. Early lambing was about over in the Snake River area from Rupert west and early shearing was progressing satisfactorily.

Vegetation showed signs of awakening under the influence of the mild weather and trees began to bud in lower valleys. Plant activity was not as advanced as a year ago, however, and hard freezes late in the month apparently did little damage. Field work was started at lower elevations in the Southwestern Division and some early peas were planted.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There wil be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation i inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standar Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effectiv January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on groun values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the recor

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of ne snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, hav been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary. Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding su scriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CORRECTION NOTE

The minus sign failed to print preceding minimum temperatures for the 8th day in Table 5 of this Bulletin for December 1953 and January 1954. Add the minus sign on December 8th for these stations: Chilly Barton Flat, Cobalt Blackbird Mine, Dixie, Dubois Experiment Station, Dubois CAA AP, Fairfield RS, Grouse, Hill City, Idaho City, Idaho Falls CAA AP, New Meadows RS, Obsidian 4 Reactor Testing Station, Spencer RS, Stibnite, and Sun Valley.

Add the minus sign on January 8th for this station: Sun Valley.

These corrections will be republished in the June 1954 issue.

MARCH 1954
Volume LVII No. 3

CHATTANOOGA: 1954

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

With average temperature for the State 1.8° below normal, March was 3.4° cooler than a year ago and the first month since June 1953 with subnormal temperatures in all divisions of the State. Like February this month's state-wide average precipitation was below normal, but one especially important feature was the above-normal precipitation in the Southeastern Division where for eight consecutive months the Division average had been subnormal. The Northern Division and Southwestern Division averages, 70% and 90% of normal, respectively, tipped the balance toward below-normal state-wide average. Snowfall generally was lighter than in any March since 1949, averaging 81% of normal for the State.

There were three cold periods during the month with greater extremes at the first and last of month and a minor cold period at mid-month. The two warmer periods fell between the 6th and 9th and the 20th to 25th, but during these two periods temperatures were not extreme with both maximums and minimums generally near normal. During the cooler periods minimums were well below normal and maximums at higher elevations below freezing. The four-day cold spell at the close of the month resulted in some damage to vegetation, but the extent of damage cannot be determined until a later date. Minimum temperatures during this period dropped down to 10° - 15° below freezing in the Southwest Division and to near zero at a few stations in the north and southeast sections. The lowest temperatures of the month for most stations occurred during the first four days when Island Park Dam had the lowest of -25° on the 3rd. Sun Valley reported -10° on the 4th.

Precipitation was rather evenly spaced with the major storms occurring during the periods 8th-12th, 17th-21st, and 24th-28th. At lower elevations most of the precipitation was in the form of rain although brief snow flurries were reported from most stations. At high levels the net loss of snow during the month was not very great. At Cascade there was 25" on the ground on the 1st and 20" at the close of the month. Sun Valley had a decrease from 27" on the 1st to 19" on the 31st. During the latter part of the month the storm track was from northwest to southeast across the Pacific Northwest, a situation which tends to bring the colder air-masses from the Arctic into Idaho and cause cold showery type of weather.

The stormy weather of the second week of March was the most severe for most stations and resulted from a series of storm centers that moved from west to east across the Pacific and into the western portion of the United States. During this period precipitation amounts were the heaviest of the month with over an inch at a number of stations and some hail and moderately high winds reported. The heavy rain on the 8th and 9th was a contributing factor in a landslide which killed two people at Bonners Ferry on March 9th.

Although there were frequent gusty winds this month velocities were not high enough to cause other than very minor damage. Sunshine for the State as a whole was below average and that combined with low temperatures tended to retard the growth of all forms of vegetation.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There wil be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation i inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standar Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effectiv January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on groun values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the recor

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of n snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, hav been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July o August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

APRIL 1954
Volume LVII No. 4

CHATTANOOGA: 1954

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

Although the Statewide average temperature for April 1954, was only slightly above normal, and average precipitation exactly normal, there were marked differences between the Northern Division and the other two. The Northern Division showed subnormal temperatures throughout, while above-normal temperatures were reported at all but a half-dozen stations in the Southwestern Division and all but two in the Southeastern Division. Only a few Northern Division stations reported precipitation totals below the April mean. In contrast, above-normal totals were reported only from the Payette River Basin and the upper portions of the Boise and Weiser Basins in the Southwestern Division, and in the Southeastern Division only a few stations in the northeast corner. Snowfall was lighter than usual for April, averaging only one inch for all stations in the State, compared to a 61-year mean of 2.3 inches. Percentage of possible sunshine was normal or a little below in the north but above normal in southern portions of the State.

Precipitation occurred rather generally over the Northern and Southwestern Divisions in periods of three to five days duration, separated by shorter intervals of fair weather. But in the Southeastern Division precipitation was less frequent and scattered until the final week when that Division received greater amounts of rain than the rest of the State. During the early part of the month a series of three storm fronts from the Pacific moved across Idaho from west to east. The first entered the State late on the 2d and the third had passed beyond the eastern boundary by the morning of the 6th. Precipitation accompanied each of the fronts with most stations in the Northern and Southwestern Divisions recording substantial amounts, but as the fronts weakened before reaching the Southeastern Division, little precipitation occurred there. During this period of frontal activity, characterized by much cloudiness, average daily temperatures were above normal, following the subnormal temperatures of April 1, when freezing temperatures in the early morning were experienced in all parts of the State. The next week was one of predominantly anti-cyclonic influence on the weather of Idaho. During this period temperatures were generally below normal, with freezing temperatures recorded in all parts of the State on the mornings of the 7th and 10th. A single storm front, passing across Idaho between the evening of the 8th and morning of the 9th, did provide a temporary break in the pattern of generally fair but cool weather. All northern stations and about 1/3 of the Southwestern Division stations reported rain, but again the Southeastern Division had only very light scattered showers. A new period of shower activity began with the approach of a storm front in the Northern Division on the evening of the 12th and ended in the Southeastern Division early in the morning of the 14th after the front had passed eastward into Wyoming. This system affected all parts of the State with nearly every station reporting some rain. Amounts ranged upward to more than an inch in the Northern Division, 1/2 to one inch at many Southwestern stations and generally less than 1/4 inch in the Southeastern. A slow moving cold front entered the northern end of the State on the evening of the 16th and travelled southward beyond the Idaho-Nevada border by the evening of the 18th. Showers accompanied the front in all sections, but only in the Northern Division was the precipitation general. Another frontal system, weakening as it passed across Idaho from northwest to southeast on the 19th, brought a few showers to the Northern Division but only scattered traces of rain elsewhere. Between the evening of the 22d and the evening of the 23d another cold front crossed the State from north to south, lowering temperatures a few degrees but causing very little precipitation. There was little change in weather conditions in the State for the next three days but by noon of the 26th a low pressure trough was developing over Idaho and a cold front began to form within the trough, which lay in a southwest to northeast direction. A wave development on the front between Boise and Salmon, retarded its southeastward movement, but by evening of the 27th the frontal system had moved out of the State, leaving in its wake moderate amounts of precipitation well distributed throughout the State. Temporary clearing of the skies on the 28th was followed by a sharp drop in nighttime temperatures and on the morning of the 29th subfreezing temperatures were general throughout the State. A vigorous storm center that developed over Nevada early on the 30th and travelled rapidly northeastward, brought a final burst of precipitation to Idaho, affecting principally the Southeastern Division where many very dry areas were greatly benefited by generous deposits of mixed rain and snow. Cold air drawn into the State from the north, kept temperatures well below normal at the end of the month.

The effects of weather on the agricultural economy of Idaho during April were variable. In the Northern Division precipitation was both frequent enough and heavy enough to cause some delay in early field work and planting, but rather extended periods of little or no precipitation in other divisions permitted rapid progress. By the end of the month seeding of spring grains was mostly completed in the main valleys of southern Idaho, while in some of the high mountain valleys it had not yet been started. In northern Idaho seeding varied from just started to nearly complete, depending on the elevation. Sugar beets were mostly planted and being thinned in the Southwestern Division, with planting well under way farther east. Planting of the southwest Idaho early potato crop was completed during the month, while in late potato areas ground was being prepared. Ground was also being prepared for bean plantings, and sweet corn for seed was being planted in southwestern counties. The freeze late in the month did little damage to field crops, except to sugar beets in some eastern districts, but the State's fruit crop suffered moderate to heavy damage. Apricots were pretty well frozen out early in the month and the freeze at the end of the month did widespread damage to peaches, prunes, and cherries, and lesser damage to apples, in unheated orchards. April's weather was generally favorable for winter wheat and production was expected to be a little above average. In general the early spring crops were doing well, and after the generous precipitation late in the month, pastures and ranges in south central and eastern parts of the State were improving, following a period of dry, windy weather.

One death during the month was attributed to meteorological factors, a man being killed in a snowslide about 12 miles south of Wallace on April 1. Storm damage during the month apparently was minor. A funnel cloud was observed in the vicinity of the National Reactor Testing Station on the 28th, being described as extending earthward from the cloud base but not reaching the ground.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There wil be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation i inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standar Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effectiv January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on groun values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the recor

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of ne snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, hav been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July o August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary. Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CHATTANOOGA: 1954

IDAHO - MAY 1954

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

With stations in all divisions reporting average temperatures above normal, this month contrasted sharply with May 1953, when negative temperature departures were recorded at nearly all stations in Idaho. There was a marked contrast in precipitation too, with all but four stations reporting subnormal rainfall this month, whereas a year ago large positive departures were the general rule.

During the first twenty days of this month precipitation was relatively infrequent, occurring only in scattered showers. On the 21st, however, general rains occurred in the Southeastern Division, and widespread showers elsewhere in the State, as a center of action developed on a storm front that had become quasi-stationary just to the south of Idaho. Daily rainfall totals of half an inch or more were common in the Southeastern Division on both the 21st and 22d, while lesser amounts were reported in other parts of the State. This period of precipitation brought to an end a spell of unseasonably hot weather, during which the mountain snowpack melted rapidly as maximum temperatures rose into the nineties at many valley stations, and above 100° at a few points. The final week of May brought subnormal temperatures and rather frequent showers to Idaho, with freezing temperatures reported in all parts of the State on the mornings of the 26th to the 28th.

Effects of weather on the agricultural economy of the State were outstanding mainly in the damaging results of freezes at the beginning of the month and during the final week. The early freeze almost completely destroyed the apricot and peach crops near Lewiston, heavily damaged early fruits in the south-central part of the State and in unheated orchards in the southwest, and did some damage to grains and other crops just beginning to grow at higher elevations. The later freeze did further damage to fruits in unheated orchards and extensive damage to beans, peas and sweet corn, with some damage to alfalfa, sugar beets and grains also reported. Despite the freezes, however, there was much good growing weather during the month and in general crops were in fairly good condition at the close. The rains toward the end of the month were of some benefit to ranges and dryland grain fields, although too late to save some of the grain in the Lewiston area, and ranges generally were reported in the worst condition for late May in the last 20 years. Because of the poor ranges this spring the general condition of cattle and sheep was somewhat below average. Farmwork was pretty much up to date at the close of the month. Sugar beet thinning was in the clean-up stage in the Southwestern Division and well along farther east. Potato planting was still going on in the Southeastern Division and some fields of sugar beets and beans were being replanted because of frost damage.

STORMS

During the afternoon and evening of Sunday, May 9, high winds were reported at a number of places in southern Idaho. Two fishermen lost their lives when their boat capsized on Lake Lowell, in Canyon County.

On the 26th small hail was reported at several points in Canyon, Gem and Payette Counties with some damage to potatoes, onions and sugar beets. May RS in Lemhi County also reported hail but no damage.

Hail fell again in Canyon County on the 31st but damage was slight.

FLOODS

Principal flooding during May occurred on the Kootenai River in the vicinity of Bonners Ferry. Below normal temperatures had prevailed during much of the spring, keeping streams at very low rates of discharge. The unseasonably hot weather of May 16-20 produced a very rapid increase in flow and the Kootenai went above flood stage at Bonners Ferry on the 19th. The crest stage of 35.4 feet, which persisted from the 21st to the 23d, was higher than in the major flood of 1948, but this time the dikes withstood the water to a greater extent and 8000 acres were inundated, as compared to 30,000 acres in 1948. The 8000 acres were all fertile farm land and much of it was under water to depths of 10 to 15 feet. A small residential district just across the river from Bonners Ferry was also flooded, but dikes held the water out of the city. Losses from the flood have been estimated at about one and a quarter millions of dollars.

Other rivers in the State, although showing the effects of the hot spell, did not experience major floods. The only other river station in Idaho to report readings above flood stage during May was Kamiah on the Clearwater. Here a stage of 14.6 feet was reached on May 21st, but no damage resulted even though bankful stage is considered 14 feet. Farther downstream, at Orofino, the water rose high enough to extinquish the fire in a sawdust incinerator at a lumber mill, necessitating a two-day shutdown, but no property damage resulted.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There wil be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation i inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standar Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effectiv January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on groun values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the recor

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurements, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of ne snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, hav been adjusted to represent the value for the full month.
R	Daily precipitation values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary. Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CLIMATOLOGICAL DATA

IDAHO

JUNE 1954
Volume LVII No. 6

CHATTANOOGA: 1954

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

In contrast to May, which was rather warm and dry in most of Idaho, June brought subnormal temperatures to all parts of the State and above normal precipitation to all but a few stations. The average temperature for the State was very nearly the same as in June 1953, one of the coolest Junes on record, and the statewide average precipitation of 166 percent of normal was the highest since 1947.

There was only one dry period of any length during the month; from the 18th through the 25th very little rain fell in the State and most of that was in the Northern Division on the 20th. Several showery periods brought substantial rains, such as the period from the 5th to the 7th, the 9th and 10th, 15th and 16th, and finally the 26th and 27th. Within these showery periods, one-day totals of more than an inch were recorded at a number of stations, amounts which in a few cases exceed the normal monthly total for the station.

Departures of average daily temperatures from normal, where such data are available, show comparatively few days during the month with temperatures above the normal. There were some outstandingly cold days, among them the 1st and 2d, 5th and 6th, 10th, 16th, 17th, and 27th to 29th. The warmest days were from about the 20th to the 26th, when cloudiness was at a minimum in all parts of the State.

On the afternoon of the 9th a slender funnel shape cloud was observed at the National Reactor Testing Station, but the funnel never reached the ground. On the same day what is believed to have been a small tornado demolished a barn and two combines near Lamont, in Fremont County.

During the afternoon of the 13th a very local hailstorm caused about 10 percent damage to 350 acres of wheat near Downey.

On the 16th the highest wind ever observed at Tetonia Experiment Station blew out five acres of new alfalfa seeding.

Heavy rains on the 26th washed out several bridges and did considerable damage to roads in the vicinity of Mackay.

Hail, wind and rain did more than $12,000 damage to peas, corn, wheat and barley in Malad Valley and near McCammon on the 27th.

Agriculturally the month might be described as "backward". Cool weather made for slow growth through much of the month and showers hampered haying until near the end of the third week. Frost on the morning of June 2 did some damage to beans, peas and sugar beets, but the damage was spotty. Scattered frost damage occurred again on the morning of the 18th with tender garden vegetables the principal victims. Finally, on the morning of the 29th, slight damage from frost was again reported, this time mainly in the vicinity of Burley. Despite cool weather crops generally fared well and with sufficient rainfall in most areas vegetation was in pretty good condition at the close of the month. Range conditions were only a little better than at the end of May, with June rainfall still not sufficient to improve feed on lower ranges where the cool, dry early season had resulted in a low average condition. The June rains did, however, improve summer range conditions in the northern and eastern parts of the State and at higher elevations. The general condition of cattle and sheep was reported a little below average.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement , time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CORRECTED DATA

DECEMBER 1953	BIG CREEK 1 S	TABLES 2 & 5: Min. temperature on 8th should be -4°, mean min. 9.9, monthly mean 22.1 and total degree days 1324.
	CHILLY BARTON FLAT	TABLE 2: Precipitation departure from normal should be +.24.
	CLARKS FORK 1 ENE	TABLES 2 & 3: Precipitation on 24th through 31st should be accumulated and monthly total accumulation (*).
DECEMBER 1953		Add the minus sign to minimum temperatures in Table 5 on the 8th for these stations: Chilly Barton Flat, Cobalt Blackbird Mine, Dixie, Dubois Experiment Station, Dubois CAA AP, Fairfield RS, Grouse, Hill City, Idaho City, Idaho Falls CAA AP, New Meadows RS Obsidian 4 NNE, Reactor Testing Station, Spencer RS, Stibnite, and Sun Valley.
JANUARY 1954		Add the minus sign to minimum temperature in Table 5 on the 8th for this station: Sun Valley.

JULY 1954
Volume LVII No. 7

CHATTANOOGA: 1954

IDAHO - JULY 1954

Archer B. Carpenter, Section Director, Boise

WEATHER SUMMARY

July continued below normal temperatures for the northern portion of the State but showed a slight positive departure for the two southern divisions. Outstanding negative departures in temperature were reported in the Cottonwood, Grangeville and Lewiston areas, where the number of days above 90° was at a minimum, except possibly at Lewiston where half of the month had maximums above 90°. Big Creek reported 11 days freezing or colder. Twenty-six stations in the Southwest Division and fourteen stations in the Southeast Division had temperatures of 90° or higher for two-thirds of the month. The highest departure from normal was 2.5° in the Southeast Division.

Precipitation was the reverse of temperature with above normal precipitation in the Northern Division and below normal in the two southern divisions. Stormy weather occurred generally throughout the month with dry days over the State reported on the 3rd, 4th, 11th, 12th, 23rd and 24th. Storms during the middle of the month were the most general over the State and considerable damage was reported in the vicinities of Grangeville, Blackfoot and Idaho Falls on the 14th; Downey on the 15th; and Canyon, Ada, Owyhee, Jerome, Lincoln, Latah and Kootenai Counties on the 16th.

The Blackfoot storm damage was estimated at $200,000 as a result of wind and hail which shelled out grain, stripped off leaves of potatoes and beat the peas level with the ground. The storm in the Idaho Falls area caused estimated damage of $300,000 as a result of wind and hail. Telephone lines, signs, buildings, automobiles and trees were damaged in and around the city and some local flooding added to the damage. The Downey storm in Bannock County on the 15th produced an estimated damage of $57,000 resulting from wind and rain. Crops were damaged, buildings and barns blown down, plate glass windows broken and utility lines torn up. The storm at Hazelton in Jerome County on the 16th produced approximately $100,000 damage due to hail and rain. There was about 90 percent loss of peas and grain, 40 percent potatoes, 25 percent of hay and clover seed in the area southeast of Hazelton. The storm in Latah County also on the 16th, produced about $95,000 damage, mostly as a result of hail. Most of this loss was due to damage of wheat, barley and peas with some roofs and windows ruined. Hailstones up to an inch and a half in diameter were reported near Potlatch.

Some crop damage resulted from minimum temperatures of 32° or lower in all divisions. The Fairfield area reported such low temperatures twice during the month. Frosts were reported in many areas on the 22nd and 23rd with principal damage to gardens, field peas, beans, corn and potatoes and slight damage to clover seeds and spring grains.

Such farm activities as cutting hay were delayed considerably over the State, and especially in the north portion, as a result of frequent showers and rainy periods. Rains were general over the State from the 13th to the 22nd. Dryland grain crops were generally favored by the rains, especially in the Lewiston-Grangeville area. Range grass continued good growth in the Northern Division and also quite satisfactory in the southern divisions but somewhat on the dry side due to subnormal precipitation.

Irrigated crops in the Southeast Division and especially in the Southwest Division created heavy demands for irrigation water. The first hay crop in many areas was of somewhat poorer quality due to delay in cutting. Some of the first hay crop in the Northern Division could not be cut until the end of the month. Early potatoes were being dug in the southwest towards the end of the month and early estimates on sugar beets in the same section indicated a record or near-record crop was developing. Grazing lands and unirrigated pastures were becoming very dry in the south half of the State toward the end of the month.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement , time distribution unknown.

/ Gage is equipped with a windshield.

This entry in time of observation column in Station Index means after rain.

Adjusted to a full month.

In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

This entry in time of observation column in Station Index means sunset.

Trace, an amount too small to measure.

Includes total for previous month.

This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CHATTANOOGA: 1954

IDAHO - AUGUST 1954

Archer B. Carpenter, Section Director - Boise

WEATHER SUMMARY

Subnormal temperatures in all parts of the State and unusually heavy rains in the Northern Division were outstanding features of Idaho's weather in August 1954. A small scattering of stations in the Southwestern and Southeastern Divisions reported average monthly temperatures above normal, but all others showed definite subnormal values; a few as much as 5° and 6° below normal.

Because of the heavy rains in the Northern Division, the statewide average precipitation is 157 percent of normal, even though the average of 47 Southwestern stations is just about normal, and the average of 44 Southeastern stations only 56 percent of normal. With only one exception, 28 Northern Division stations reported rainfall totals more than double the August normal and at many stations the totals were three to four times the normal. Only once in 62 years of record has the average August rainfall in the Northern Division exceeded that of this year; in 1926 the Division average was 2.84 inches.

Except for rather widespread showers in the Southeastern Division on the 5th and again on the 12th, rainfall was of little consequence in Idaho during the first half of August. The second half, on the other hand, brought showers almost daily to some part of the State with the Northern Division, of course, receiving by far the greater part of these showers. Although there was a sparsity of showers during the first half, and much greater precipitation frequency during the second half, the thunderstorm activity reached its peak in the forests of southern Idaho during the relatively dry period from the 12th through the 15th. A large number of forest fires resulted from the widespread dry thunderstorm activity, but prompt action by fire control agencies resulted in suppression of the fires before they had spread over more than a few acres. Rather general shower activity, particularly in the mountain areas where some snow was reported above 9,000 feet, began on the 20th and the fire hazard on forest lands dropped abruptly from extreme to low or average. In the Northern Division the precipitation was both frequent and widespread during much of the remainder of the month, while in the Southwestern and Southeastern Divisions shower activity became generally light and scattered after the 21st.

The shower activity of the 5th and 12th in the Southeastern Division was accompanied by damaging hailstorms in some localities. Cassia, Power, Caribou and Bonneville Counties reported hail damage to grain on the 5th, while similar damage was reported on the 12th in Bannock, Power, Custer and Lincoln Counties. Near Shoshone on the 12th lightning killed three head of cattle, knocked a man off a combine and started four range fires. On August 16th numerous hailstorms struck Kootenai, Latah, Lewis and Nez Perce Counties but no definite information on damage is available. Shoshone and Lincoln Counties were hit by hailstorms on the afternoon of the 21st with considerable damage to grain. The counties of Lewis, Nez Perce and Idaho had hailstorms on the 26th and the same three counties, plus Kootenai and Latah, were hit again on the 30th. In both instances there was considerable damage to grain and to peas still in the field, and in the later storm lightning knocked out several people in Nezperce and set fire to the home of our observer there.

Despite the damaging hailstorms, the weather during August was not unusually detrimental to the agricultural economy of the State. The generally fine weather of the first half of the month permitted normal growth of crops and early harvest operations were carried on under favorable conditions. During the later half, moderate to heavy rainfall in the Northern Division delayed all harvest operations, but at the same time greatly benefited ranges and pastures. The light and scattered showers in the southern portions of the State caused little delay in harvesting. On the whole the prospects for all crops were a little better at the end of the month than at the end of July, even though below-normal temperatures the last half-month retarded growth and maturity of crops, and frost at higher elevations on the 18th, 23d and 27th did limited damage, particularly to potatoes. Range conditions declined less than usual during the month, but the feed outlook was still below average. In the Northern Division and at higher elevations elsewhere the ranges were in good condition, while lower southern areas were dry with just fair feed. Both cattle and sheep continued in good condition but were still below average. Water supplies on irrigation projects were holding up well except in some areas south of the Snake River.

DJS

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement , time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

SEPTEMBER 1954
Volume LVII No. 9

CHATTANOOGA: 1954

WEATHER SUMMARY

Slightly above normal temperature for the State as a whole, deficient rainfall, above average sunshine, and excessive windiness characterized the weather during September. The frost-free period or growing season was generally ended during the month, making the frost-free period shorter than usual.

The average temperature of the State, weighted in accordance with the areas of the three Divisions, was 57.7°, 0.4° above the weighted normal. The Northern Division was the coolest, 0.9° below normal, and the Southeastern Division, 1.1° above normal, was the warmest. The highest recorded mean temperature was 67.9° at Swan Falls Power House; the lowest was 46.7° at the Civil Aeronautics Administration station at Mullan Pass. Grand View recorded the highest maximum temperature of the month, 100° on the 10th; Three Creek reported the lowest, 8° on the 30th. This was the coolest September since 1948. There were several reports of frosts during the month, and nearly all stations reported freezing temperatures by the end of the month.

The month opened with warmer than normal weather for the first two or three days, followed by general cooling trends until about the 9th or 10th, when a warm spell, lasting only two or three days, occurred. Monthly maximum temperatures were recorded at most stations either on the first two days or around the 10th. With the exception of the 14th, which was a warm day, the rest of the first three weeks was cool. Large departures below the average daily normal temperatures were recorded during the third week, centering around the 17th or 18th. The 21st or 22nd began a period of warm weather, some individual days at points in the southern part of the State, reaching 8° or 10° above the daily normal. Cold air began to spread over the State on the 28th, and the last two days of the month were abnormally cold. The 29th was generally between 10° and 20° below normal, and monthly minimum temperatures were recorded at the majority of stations on the 30th.

The State average precipitation, weighted in proportion to the areas of the Divisions, was 0.54 inch, .45 inch below the weighted normal, making this the wettest September since 1950. The Northern Division, with 82 percent of normal rainfall, was the wettest. The Southeastern Division averaged 41 percent of normal precipitation, and the Southwestern only 33 percent. Twelve stations reported no precipitation at all. Only a few scattered stations reported more than the normal rainfall. The greatest monthly amount was 3.44 inches recorded at Burke 2 NNE, and Mullan Pass, with 3.36 inches, was the only other station reporting in excess of 3.00 inches of rainfall. The largest amount recorded for an observational day was 1.63 inches at Kellogg on the 18th. Periods of fairly widespread precipitation were 2nd - 5th, 12th, 15th - 18th, 23rd, and the last two days of the month.

Harvesting of peas, hay and grains was prolonged in the northern portions of the State due to showery weather, with considerable damage to peas, oats and barley in the Lewiston area from rain. In other areas, except at high levels, grain harvests were virtually completed. Grain harvests turned out generally better than had been expected earlier. The peach and pear crops were gathered, with apple picking beginning the third week. Sugar beet digging began during the latter part of the month, and the harvesting of potatoes continued with near-average yields expected. In the higher mountain valleys and at intermediate levels, freezing temperatures were reported several times during the month with damage to tender crops, and the general freeze at the end of the month ended the season for most garden crops. Truck crop harvesting continued, with about the average onion yields expected, and the fall lettuce expected to be about the same as last year, although only about 25 percent of the previous 10-year average. Conditions were generally favorable for the carrot harvest. The dry bean harvest was fairly well along at month's end. Ranges and pastures continued good to excellent in the northern portion of the State, but were generally dry in the lower elevations of the south-central and southwestern portions, and in the eastern portion.

Lightning killed a young man on Mt. Borah in Custer County, and the wind blew a roof off a house at Chilly, near Barton Flat, both unfortunate events occurring on the 2nd. On the 4th, hailstones up to 1/2 inch in diameter did extensive damage to grains in a few localities, particularly southeast of Driggs, and the hard rains on the 4th and 5th lodged grains and cracked pea pods in Idaho and Lewis Counties, effectively reducing yields. Hail was reported in Latah County on the 16th and in Latah, Lewis, Nez Perce and Idaho Counties on the 17th, some hailstones on the latter date being reported as from 1/4 inch to 3/8 inch in diameter. Principal damage, however, seemed to be caused by the accompanying rains which damaged pea and grain crops ready for the harvest.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement , time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

CLIMATOLOGICAL DATA

IDAHO

OCTOBER 1954
Volume LVII No. 10

CHATTANOOGA: 1954

WEATHER SUMMARY

October was a cool month, the coolest since 1949, and quite dry on an average, less than one-half the normal average precipitation occurring over the State. In spite of the low average precipitation, the snowfall average was nearly equal to the mean of the last 56 years, reflecting the high percentage of precipitation that occurred as snow in many areas. Considerable wind was recorded, gusts exceeding 60 miles per hour being reported from several localities, with attendant duststorms, particularly in association with the passage of the month's most important storms. Weather was generally favorable for harvesting operations, but the cool, often frosty weather retarded growth of pasture feed and made for somewhat adverse fall growing conditions, particularly in the more southerly areas of the State.

The average temperature for the State was 45.6°, 1.8° below normal. The month opened, as September had closed, with temperatures well below normal and effective warming did not occur generally until around the 6th or 7th. By the end of the second week, temperatures were 5° to 15° below normal again as the first general storm of the month moved across the State. From around the 16th up to near the beginning of the 4th week temperatures were near to substantially above normal, when pronounced cooling again occurred in the wake of the storms which were recurrent during the latter part of the third week and beginning of the 4th. From then on until the end of the month temperatures remained substantially below normal, although they were moderating generally by month's end. The highest temperature for the month was 87°, recorded at Grand View on the 6th; the lowest was 0° at Gray on the 27th.

The average precipitation for Idaho was 0.66 inch, 0.76 inch below normal. Relatively, the precipitation deficiency was least in the Northern Division and greatest in the Southwestern. The greatest monthly total was 3.61 inches at Wallace, the only station in the Northern Division with an above normal total. Grouse was the only station which reported no precipitation whatsoever. Mullan Pass CAA reported the greatest 24-hour amount, 1.24 inches on the 21st. Gray reported a snowfall total for the month of 10.0 inches, and Mullan Pass CAA and Conda each reported 8.0 inches. Higher level stations in the Northern Division and Southwestern Division reported snow during the month, and all but a very few stations in the Southeastern Division had snow, many reporting substantial amounts. Three stations in the Southeastern Division reported monthly total precipitation slightly in excess of normal amounts, but in general large deficiencies were the rule in all areas. The storm periods were with minor exceptions from around the 10th or 11th through the 13th, this storm being general over the State; and from the 17th to about the 25th, this period being one with a series of storms that variously affected different parts of the State with respect to the dates of rainfall or snow.

The Crop Reporting Service indicated that potato, dry bean and sugar beet harvests were expected to be somewhat below earlier estimates because of adverse fall growing conditions, although in general crop production was good, the Idaho Crop Production Index as of November 1 being 111.6, exceeded only by that of 1953. Range feed conditions were about 10 points below average, although northern ranges have been generally benefitted by fall moisture, and the October precipitation helped some southern ranges. Irrigation was necessary due to the dryness of the soil prior to sugar beet harvesting in some fields in southern localities. Frosts caused some loss to the bean harvest. The moisture necessary for fall seeding of grains was provided in most areas of the southern part of the State by the snows of late October, although these were a temporary hindrance to the harvest in places. There was some wind damage to seeded fields, the seeds and topsoil being blown about or away in several places. Hay in windrows was scattered in some areas, and other field crops damaged. Particulars on the most severe of the windstorms, as furnished by the State Climatologist, are given below:

WINDSTORM OF OCTOBER 11

Strong winds followed a fast moving cold front that swept across southern Idaho between early morning and mid-afternoon. Nearly all southern Idaho stations reported high winds but only a few details about damage have been obtained. At Tetonia some fields of winter wheat were blown out and much topsoil was blown from fallow fields. Old timers called it the worst blow in the history of the area. At Sugar wind damage to buildings and at Idaho Falls, where gusts to 72 mph were recorded, some shingles were blown off. Potato harvest in that area was temporarily halted, dust clouds delayed traffic on highways and caused several minor accidents. Telephone and power lines were temporarily out of order at various points in the Snake River Valley. Near Bliss the wind blew seed and beans that had not been harvested and badly scattered hay that was in windrows.

H. C. Steffan

The four digit identification numbers in the index number column of the Station Index are assigned on a state bases. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement , time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
AR	This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

NOVEMBER 1954
Volume LVII No. 11

ASHEVILLE: 1954

WEATHER SUMMARY

Like November 1953, this was an abnormally warm month, only seven warmer Novembers having been experienced since 1892. Precipitation was only about 63 percent of normal, and the average snowfall for the State was only 12 percent of the mean of the previous 56 years. Particularly in the southern part of the State storms were relatively few and of short duration, interrupting only briefly the persistent high pressure patterns dominating the area. Sunshine was abundant for the time of year, and, except for fogs that occasionally hampered transportation in places and minor wind damage in one or two localities, the weather was agreeable for seasonal activities and generally favorable for livestock. A fatal highway accident attributable to blowing dust occurred during the month.

The average temperature for the State was 39.9°, 4.6° above normal. The northern portion was a few degrees below seasonal temperature averages the first few days of the month, while other areas were close to normal values. By the second week, all areas were warmer than average, and remained so until the 28th, when effective cooling occurred over the entire State. The highest recorded temperature was 75° at Atlanta 1 E on the 6th. The lowest was -17° at Dixie on the 30th. The maximum temperature at Pocatello WB AP on the 11th, 70°, was the highest ever recorded so late in the season. Lewiston WB AP reported that the high temperature of 62° on the 7th equalled the previous record for that date, and the Priest River Experiment Forest noted that its November average maximum temperature of 45.7° was the highest since 1912.

The State average precipitation was 1.22 inches, 0.73 inch below normal. The average snowfall of 0.7 inch was the third lowest of record. In 1904, the average of 0.7 inch equalled this year's. Only in 1929 and 1939 did the respective averages of 0.6 inch and trace fall below that of this November. Only Dixie and Mullan Pass CAA recorded snowfall totals for the month in excess of ten inches, the former with 13.0 inches and the latter with 22.1 inches. In the two southern divisions, precipitation was generally confined to the periods around the 12th - 13th, the 15th - 17th, and 25th - 27th, the latter period being mostly one of scattered showers and snow flurries. In the Northern Division, storms were more frequent and generally of longer duration. However, with reference to normal precipitation amounts, most stations with excesses were in the northern or southeastern portions of the Southeastern Division or the west-central portion of the Southwestern Division. Deficiencies of well over 1.00 inch were not uncommon elsewhere in areas normally receiving abundant precipitation. The largest monthly total was 5.39 inches recorded at Burke 2 NNE, and the least was a trace at Three Creek. Preston Sugar Factory 2 SE recorded the greatest amount in an observational day: 1.14 inches on the 16th.

According to reports from the Agricultural Marketing Service, ranges were short on feed except in northern Idaho where rainfall had been sufficient during the summer. The mild weather and the November rains were of some benefit to grazing areas. As of the December 1 report, the average range condition was 72 (the 10-year average 1943-1952 is 80), 2 points better than at the same time in 1952, but otherwise the lowest since 1934. Cattle and sheep were in fairly good condition. Hay was generally ample except in a few localities.

Seasonal agricultural activities which continued into the month, such as fall plowing, were generally favored by the weather. Heavy night and morning fogs in northern and western valleys somewhat impeded transportation on a few days toward the end of the month. On the 11th and 27th winds with peak gusts from 42 to 53 miles per hour were reported from a few points in the Southeastern Division, but damage was slight.

On the 25th, visibility restricted by blowing dust was the cause of a traffic accident 25 miles southeast of Burley which involved three vehicles. Six persons were burned to death in one auto, and five occupants of another injured.

H. C. Steffan

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement , time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

IDAHO

DECEMBER 1954
Volume LVII No. 12

ASHEVILLE: 1955

WEATHER SUMMARY

From the standpoint of average precipitation, this must be numbered among the drier Decembers, only twelve previously recorded Decembers having been drier, the latest in 1947. It is also the fourth successive month of deficient precipitation. Since December temperatures were in general below normal, the picture is a little more favorable with regard to the snow pack in the mountains, which improved somewhat more than the average precipitation figures would indicate. Average snowfall for the State was only about two inches less than the 13.1-inch mean of the last 57 years. The warm spell at the end of the month, however, melted much of the snow in the lower valleys. In general the weather was fairly open, with more than average sunshine. Windiness was not excessive, and reports of wind damage were few.

The average temperature for the State was 24.7°, 1.6° below normal. Station mean monthly temperatures ranged from the low of 13.6° at Chilly Barton Flat to the high of 34.4° at Lewiston Water Plant. Monthly extremes were well within the range of those previously recorded. The highest temperature of the month was 65° at Deer Flat Dam on the 6th; the lowest -33° at Island Park Dam on the 27th.

The average precipitation for Idaho was 1.34 inches, 0.62 inch below normal. A few scattered stations, mostly in the southern part of the State, reported precipitation amounts in excess of normal. Most stations in the Gooding-Shoshone area reported slight excesses. Otherwise precipitation was generally deficient. At Deadwood Dam the deficiency amounted to 3.43 inches, and many stations in the Northern and Southwestern Divisions recorded monthly totals between one and two inches below normal. The Northern Division recorded 70% of average precipitation, the Southwestern 65%, and the Southeastern 72%. The greatest monthly total was 4.56 inches at Mullan Pass CAA; the least was 0.13 at both Chilly Barton Flat and Howe. Lewiston, with a monthly total of 0.20 inch, reported this to be the driest December there since 1900. The largest total for an observational day was 1.59 inches recorded at Arrowrock Dam on the 31st. Snowfall for the month was 86% of the 57-year mean, although melting was considerable, especially near the end of the month when temperatures rose. Much precipitation in the storm at month's end was in the form of mixed rain and snow. Many stations at higher elevations, however, reported snow depths on the 31st in excess of 12 inches. At Mullan Pass CAA there were 38 inches of snow on the ground at the end of the month; at Burke 2 NNE, 34 inches; at Island Park Dam, 32 inches; at Deadwood Dam, 28 inches; and at McCall, 21 inches.

The month began with temperatures generally below normal, as much as 10° below in some localities, with very little precipitation occurring. By the 3d, warming was general and all areas were reporting rain or snow, as they did again beginning the 6th after falling off to scattered occurrences on the 5th between general storms. Near normal temperatures prevailed after the 8th in the north and west with considerable precipitation reported in the north, but the southeast portion cooled to substantially below normal temperatures. Precipitation was again fairly general over the State by the 10th, falling off to scattered occurrences the next day. By the 13th, all areas had temperatures near or above normal, and precipitation was again general. Temperatures remained near or above normal through the 15th, and precipitation, which had diminished on the 14th, was renewed by another general storm. Beginning the 16th or 17th, the entire State was under the influence of high barometric pressures. Temperatures dropped to well below normal daily values, especially in the southeast portion where daily departures as much as 16° below normal were reported, and precipitation was entirely absent. Precipitation was next reported in the northern portion on the 22d. and elsewhere on the 24th or 25th, with scattered reports of precipitation in all areas up to the 28th, becoming general thereafter. Average temperatures on the 26th through the 28th were well below normal, especially in the southeast where the anomaly at Pocatello on the 28th was -25°. The majority of stations reported their monthly minimums during this time. Warming was general after the 28th, and the month ended with temperatures well above normal, much precipitation occurring as rain, and with snow melting in the lower valleys.

The average range condition was reported by the Agricultural Marketing Service to be one point above the previous month, but still 8 points below the 10-year (1944-53) average of 81. Livestock generally remained in good condition, due in part to supplemental feeding.

There were no severe storms during the month.

H. C. Steffan

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables,are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST and 5:30 a.m., MST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amounts included in following measurement , time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	**Amounts from recording gage.** (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
SS	This entry in time of observation column in Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
VAR	This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

ANNUAL SUMMARY 1954

Volume LVII No. 13

ASHEVILLE: 1955

WEATHER SUMMARY

GENERAL: It was persistently but not excessively dry throughout the year, except for the wettest June since 1947. It was a little drier in the Southeastern Division than elsewhere, and soil moisture shortages were reported from much of that area periodically throughout the growing season. In the Southeastern Division the June average of 1.99 inches was over three-quarters of an inch above normal, but it was only the second month in 12 to average above normal figures for the area, and the last 6 months of 1954 were consistently dry. There were very few unusual extremes of temperature during the year. There were a number of severe storms, mostly hail and wind.

TEMPERATURES: The yearly average temperature for the State as a whole was 46.3°, 0.7° above normal; but as usual, this is an over-refinement. Actually, the Northern Division averaged about 1° below normal, while the two southern Divisions averaged between 1° and 2° above normal. The State's warmest reading for 1954 was 107° at Grand View on July 4; the coldest -33° at Island Park Dam on December 27. At Pocatello, the 70° maximum on November 11 was the warmest there of record so late in the season. Cool weather throughout the year in the Northern Division contributed to a little slower than usual crop season, particularly north of Lewiston; but warmth in southern areas speeded the season along where moisture was adequate. Freezes late in April and early in May caused damage, varying in degree from light to serious, to fruit crops. Apricots were hit hard early in April, and other fruits later on, especially in unheated orchards. Peach and apricot crops near Lewiston were almost total failures because of these freezes. The warmest average for any station for the year was 56.3° at Swan Falls Powerhouse, 1.6° warmer than normal. The coldest average was 35.8° at Cobalt Blackbird Mine in Lemhi County. Mullan Pass CAA averaged 0.9° below normal with an average mean for the year of 36.5°.

PRECIPITATION: The year averaged rather dry, but not unusually so, with the statewide average of 15.24 inches running 1.96 inches below normal. However, the almost continuous dryness throughout the year in the Southeastern Division, following a dry second half of 1953, had produced conditions approaching drought in much of the area. The Division average total of 9.98 inches was 2.75 inches below normal. On the other hand, the Northern Division had a fairly wet year, averaging 1.95 inches wetter than the period mean. The year ended with adequate moisture supplies in the Northern Division, but ranges and dry land farms in the southern Divisions were dry. The wettest station for the year was Burke 2 NNE with a total of 59.26 inches, 14.04 inches above normal; while the driest place with a complete year's measurements was Mountain Home 1 NE with 5.56 inches, although Strevell had a 5.49-inch total for the year with December total partially estimated. At Three Creek, Owyhee County, the 7.12-inch total was 6.55 inches less than normal, reflecting the very dry conditions experienced along the Nevada-Utah Border.

DESTRUCTIVE STORMS: The year's variety of destructive storms was not particularly unusual, except that any severe storm is likely to be considered unusual in the area it strikes. Northern counties experienced heavy snowstorms twice in January which caused power and communication line failures, and temporary closure of some highways. On April 1 a man was killed in a snowslide near Wallace. There were several windstorms during the year, mostly accompanied by minor damage. However, the windstorm of October 11 was noteworthy in several ways. It struck nearly all of southern Idaho during the day, but was particularly damaging in the Southeastern Division, where blowing dust delayed traffic on highways; there was considerable structural (especially to roofs and power lines) damage, fallow fields suffered loss of topsoil, and some winter wheat fields were blown out. This is the same windstorm which struck the Jackson Hole part of Wyoming the same day. On November 25 a dust storm southeast of Burley contributed to a 3-car collision, in which six persons perished. Two fishermen lost their lives on May 9 when gusty winds capsized their boat on Lake Lowell. Although hail damage seems to have been less extensive than usual for the year, there were a few heavy hailstorms mostly in July and August. Hailstorms the middle of July in southeastern counties caused damage to crops totaling over $600,000. Hailstones 1-1/2 inches in diameter were reported near Potlatch on the 16th during the second of two storms in northern Idaho (Idaho County on the 14th, Latah County on the 16th) which caused $125,000 in crop damage. August hailstorms also caused much crop damage, but accompanying thunderstorms were more spectacular. Lightning set a large number of forest and range fires in southern Idaho, killed several head of cattle near Shoshone, and even set fire to the home of the Nezperce observer. Hail damage was reported in scattered areas the first half of September, and a young man on Mt. Borah was killed by lightning on September 2. In connection with thunderstorm activity on April 28 and June 9, funnel clouds were observed near Arco, but did not appear to reach the ground. A small tornado demolished a barn and two combines on June 9 near Lamont.

The only important flooding of the year was along the Kootenai River in the Bonners Ferry area. Flooding lasted for five days beginning May 19. While the flood crest actually was higher than during the 1948 major flood, damage and area covered were much less because dikes withstood the floodwaters much better than in 1948. Damage was extensive, with 8,000 acres of fertile farm land inundated to depths up to 15 feet. The Corps of Engineers has issued a report of damage from this flood.

In the southern Divisions it was dry all year except in June, and ranges were in poor condition at the end of the year. In the Northern Division ranges were good. Stock were faring well, but short feed in southern areas was producing short weights. Grain yields were generally fair to good, and were better in southern areas than the dry year had led people to expect. Yields were very good in some northern areas where excessive moisture and the relatively cool growing season caused a minimum of trouble. Aside from local severe storm damage, crops otherwise had a fairly good year.

R. A. Dightman

LENGTH OF RECORD, IN YEARS, HAS BEEN REVISED TO SHOW THE TOTAL NUMBER OF YEARS IN WHICH RECORDS ARE COMPLETE FOR ALL 12 MONTHS OF THE YEAR EXCEPT FOR "EVAPORATION" STATIONS IN WHICH CASE THE NUMBER OF COMPLETE RECORDS FOR THE SEASON BETWEEN FREEZING IN SPRING AND AUTUMN IS SHOWN.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

- No record.
+ Also later date (dates) or months.
* Amount included in following measurement.
// Gage is equipped with a windshield.
B Adjusted to full month.
C Data for recorder stations denoted by "C" are processed for special purposes and published in "Hourly Precipitation Data". Length of record for recorder-only stations may be found in the annual issue of "Hourly Precipitation Data".
E Amount is wholly or partially estimated.
M Less than a complete month of record available; if average value is entered, less than 10 days of record are missing. See monthly Climatological Data for detailed daily record.
R Data from recording gage.
T Trace, an amount too small to measure.
V Includes total for previous months. V in annual column means total is for a two-year period.
S Storage precipitation station. Data will be published in the July or August or delayed data December issue of Climatological Data.

Additional information regarding the climate of Idaho may be obtained by writing to any Weather Bureau Office or to the State Climatologist at, Weather Bureau Airport Station, Box 1718, Boise Idaho.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to Superintendent of Documents, Government Printing Office, Washington 25, D. C.
